National
Supercomputing
Mission

Centre for
Development of
Advanced Computing

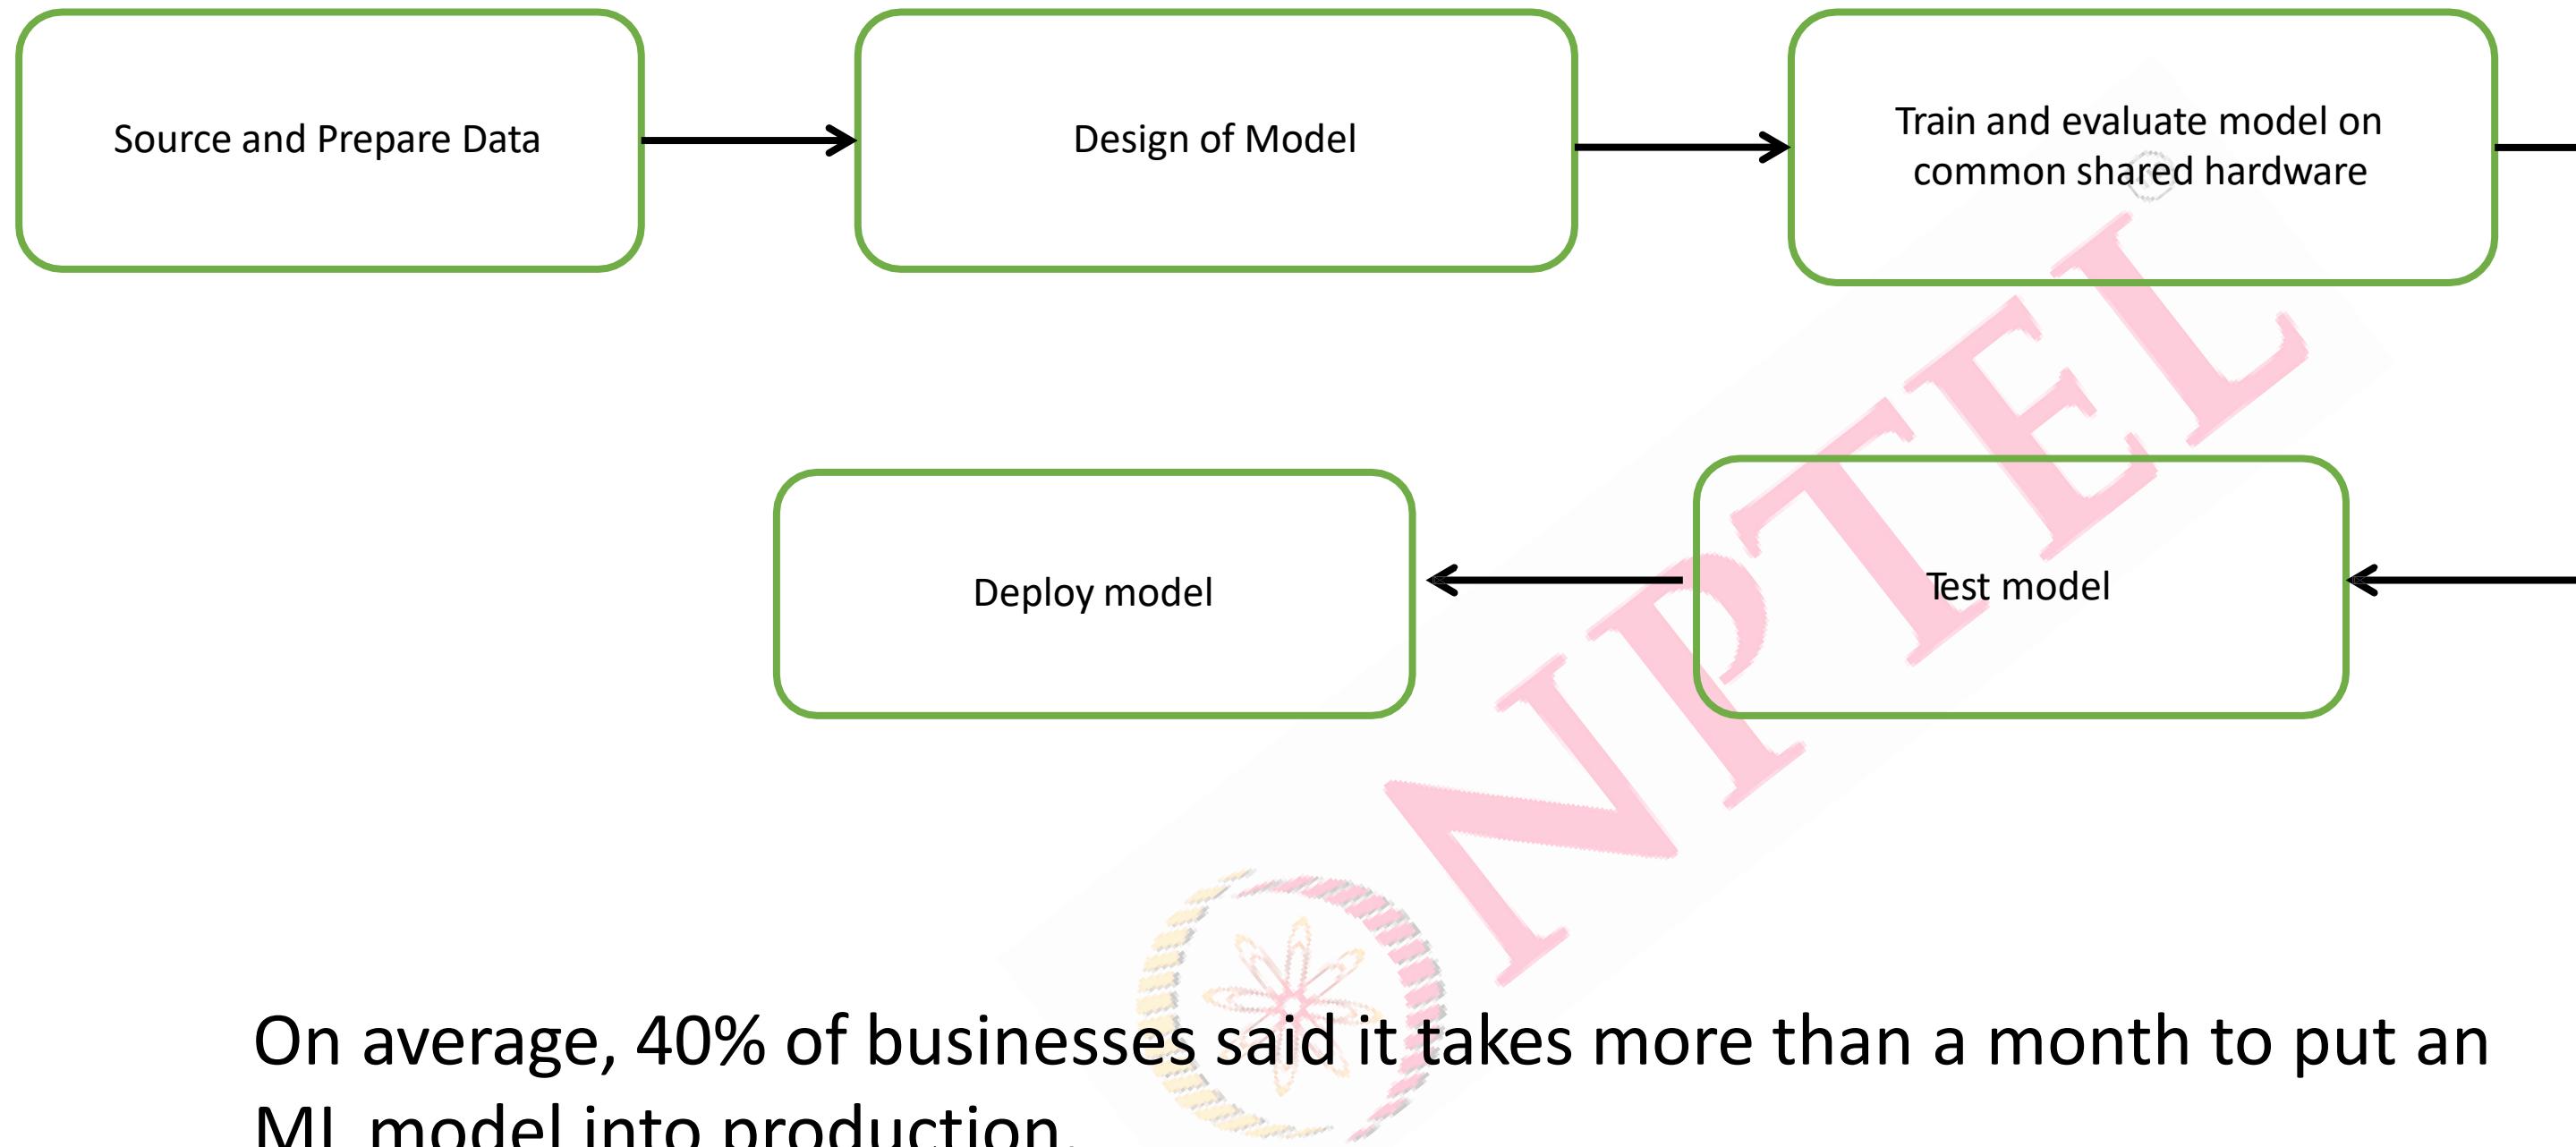

Agenda

- ML workflow and problems faced
- Demo – Dockers
- NGC
- Jupyter Notebook
- Demo – Jupyter Notebook

Generic ML workflow ?

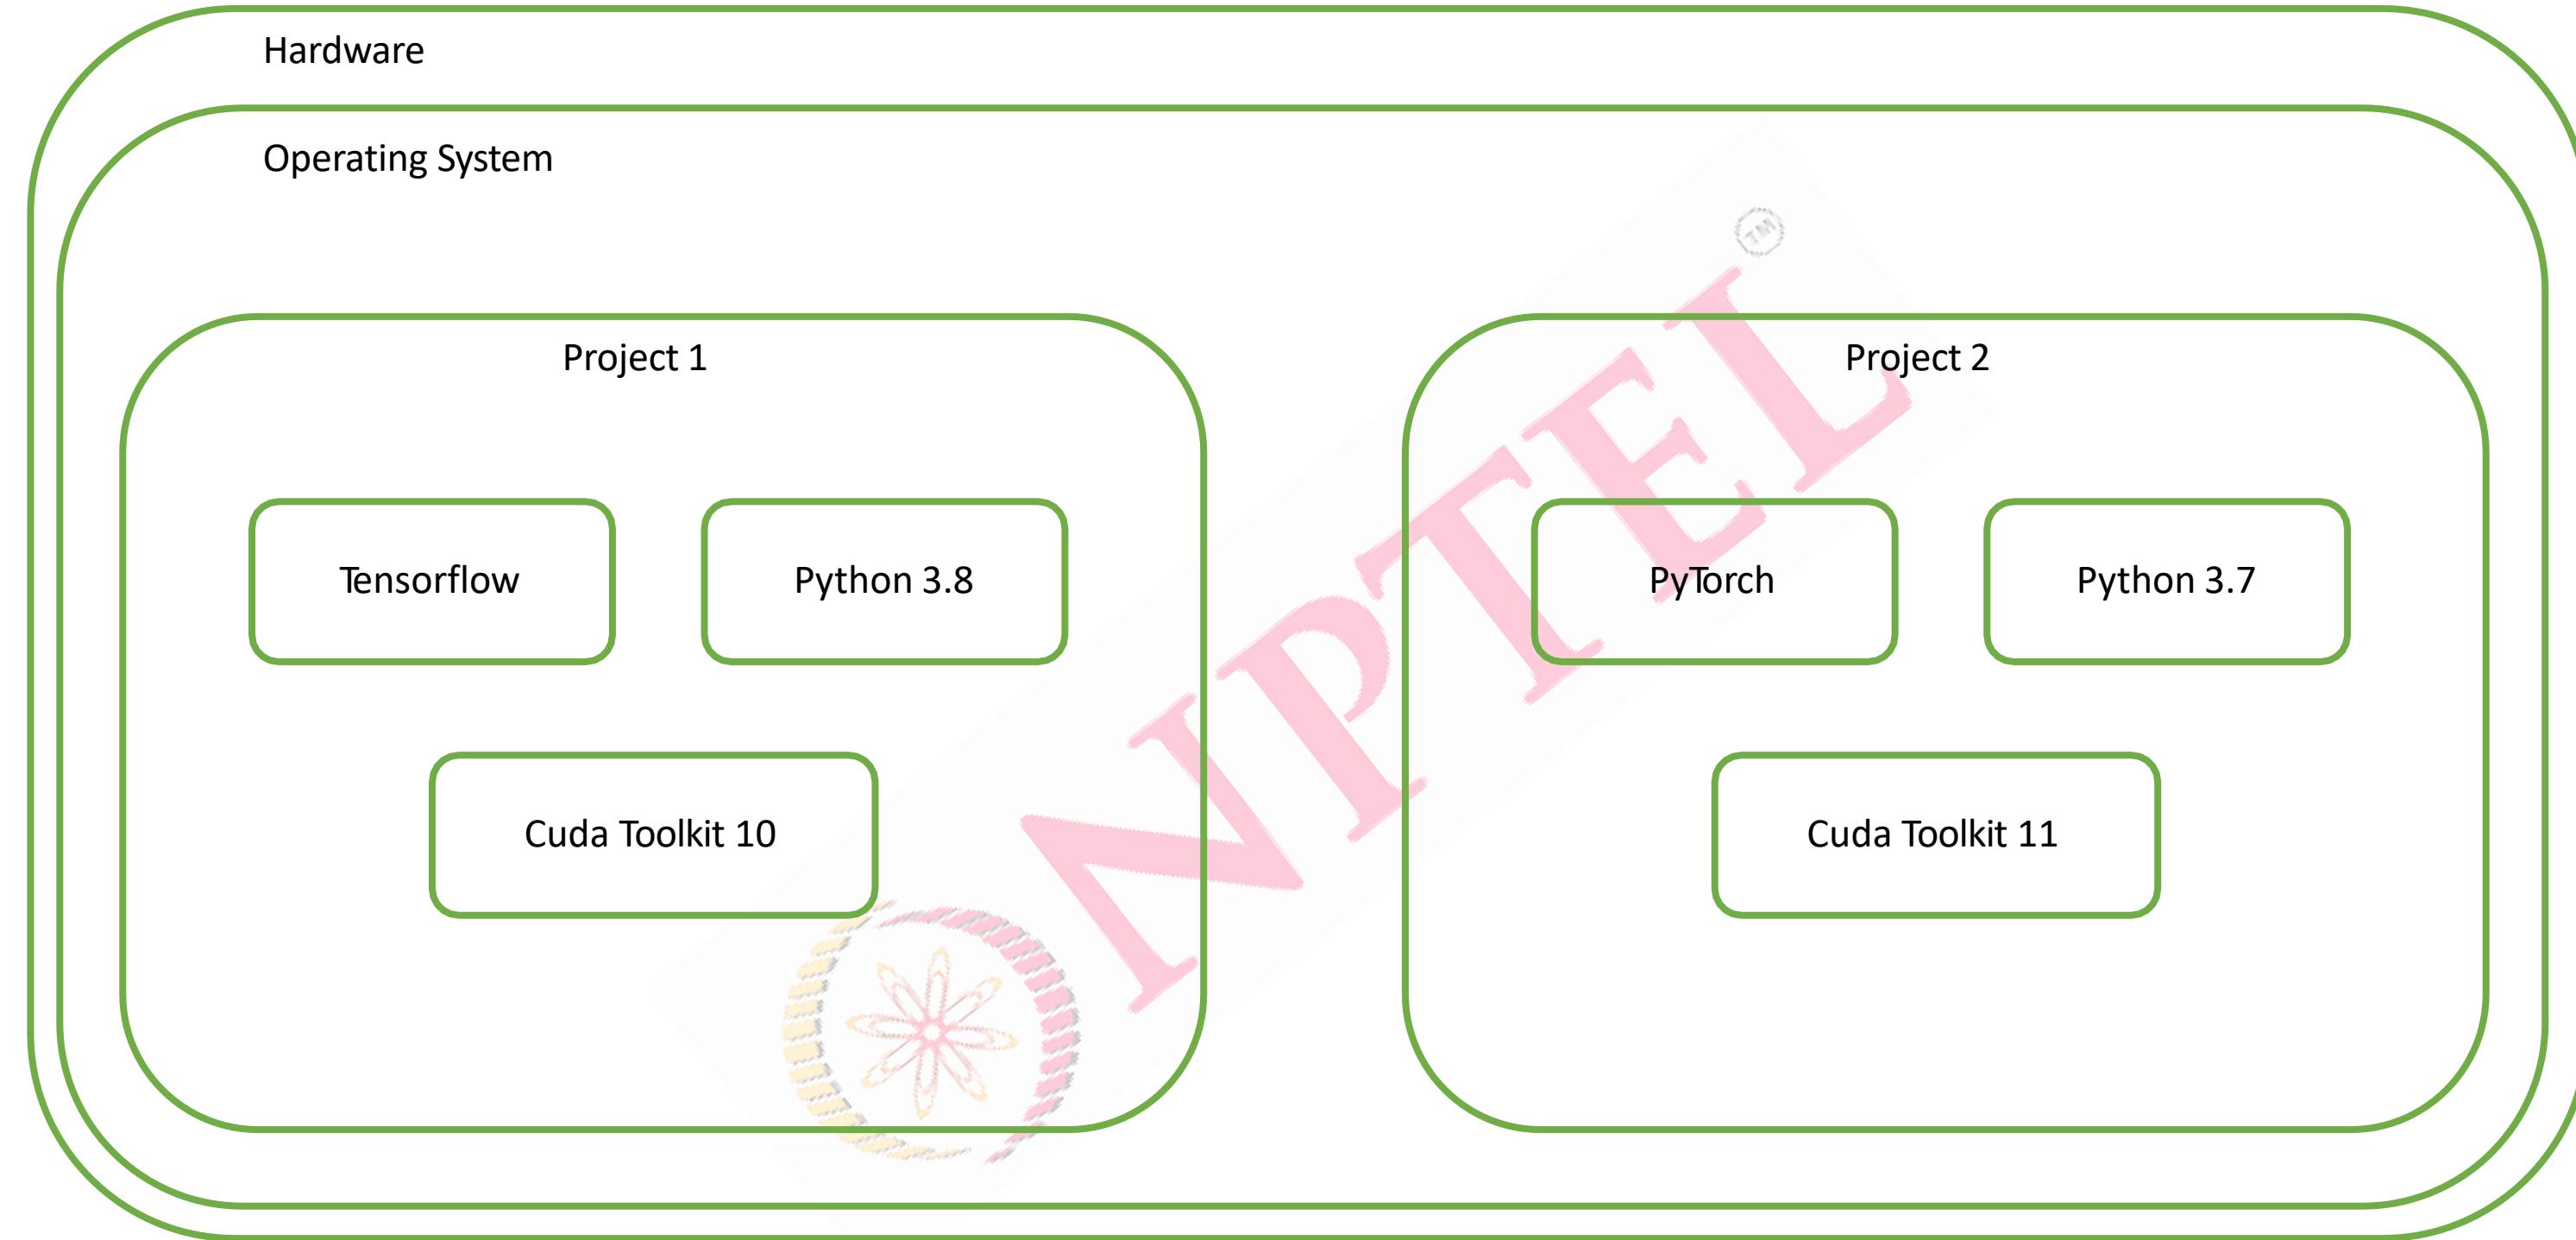

On average, 40% of businesses said it takes more than a month to put an ML model into production.

Problems

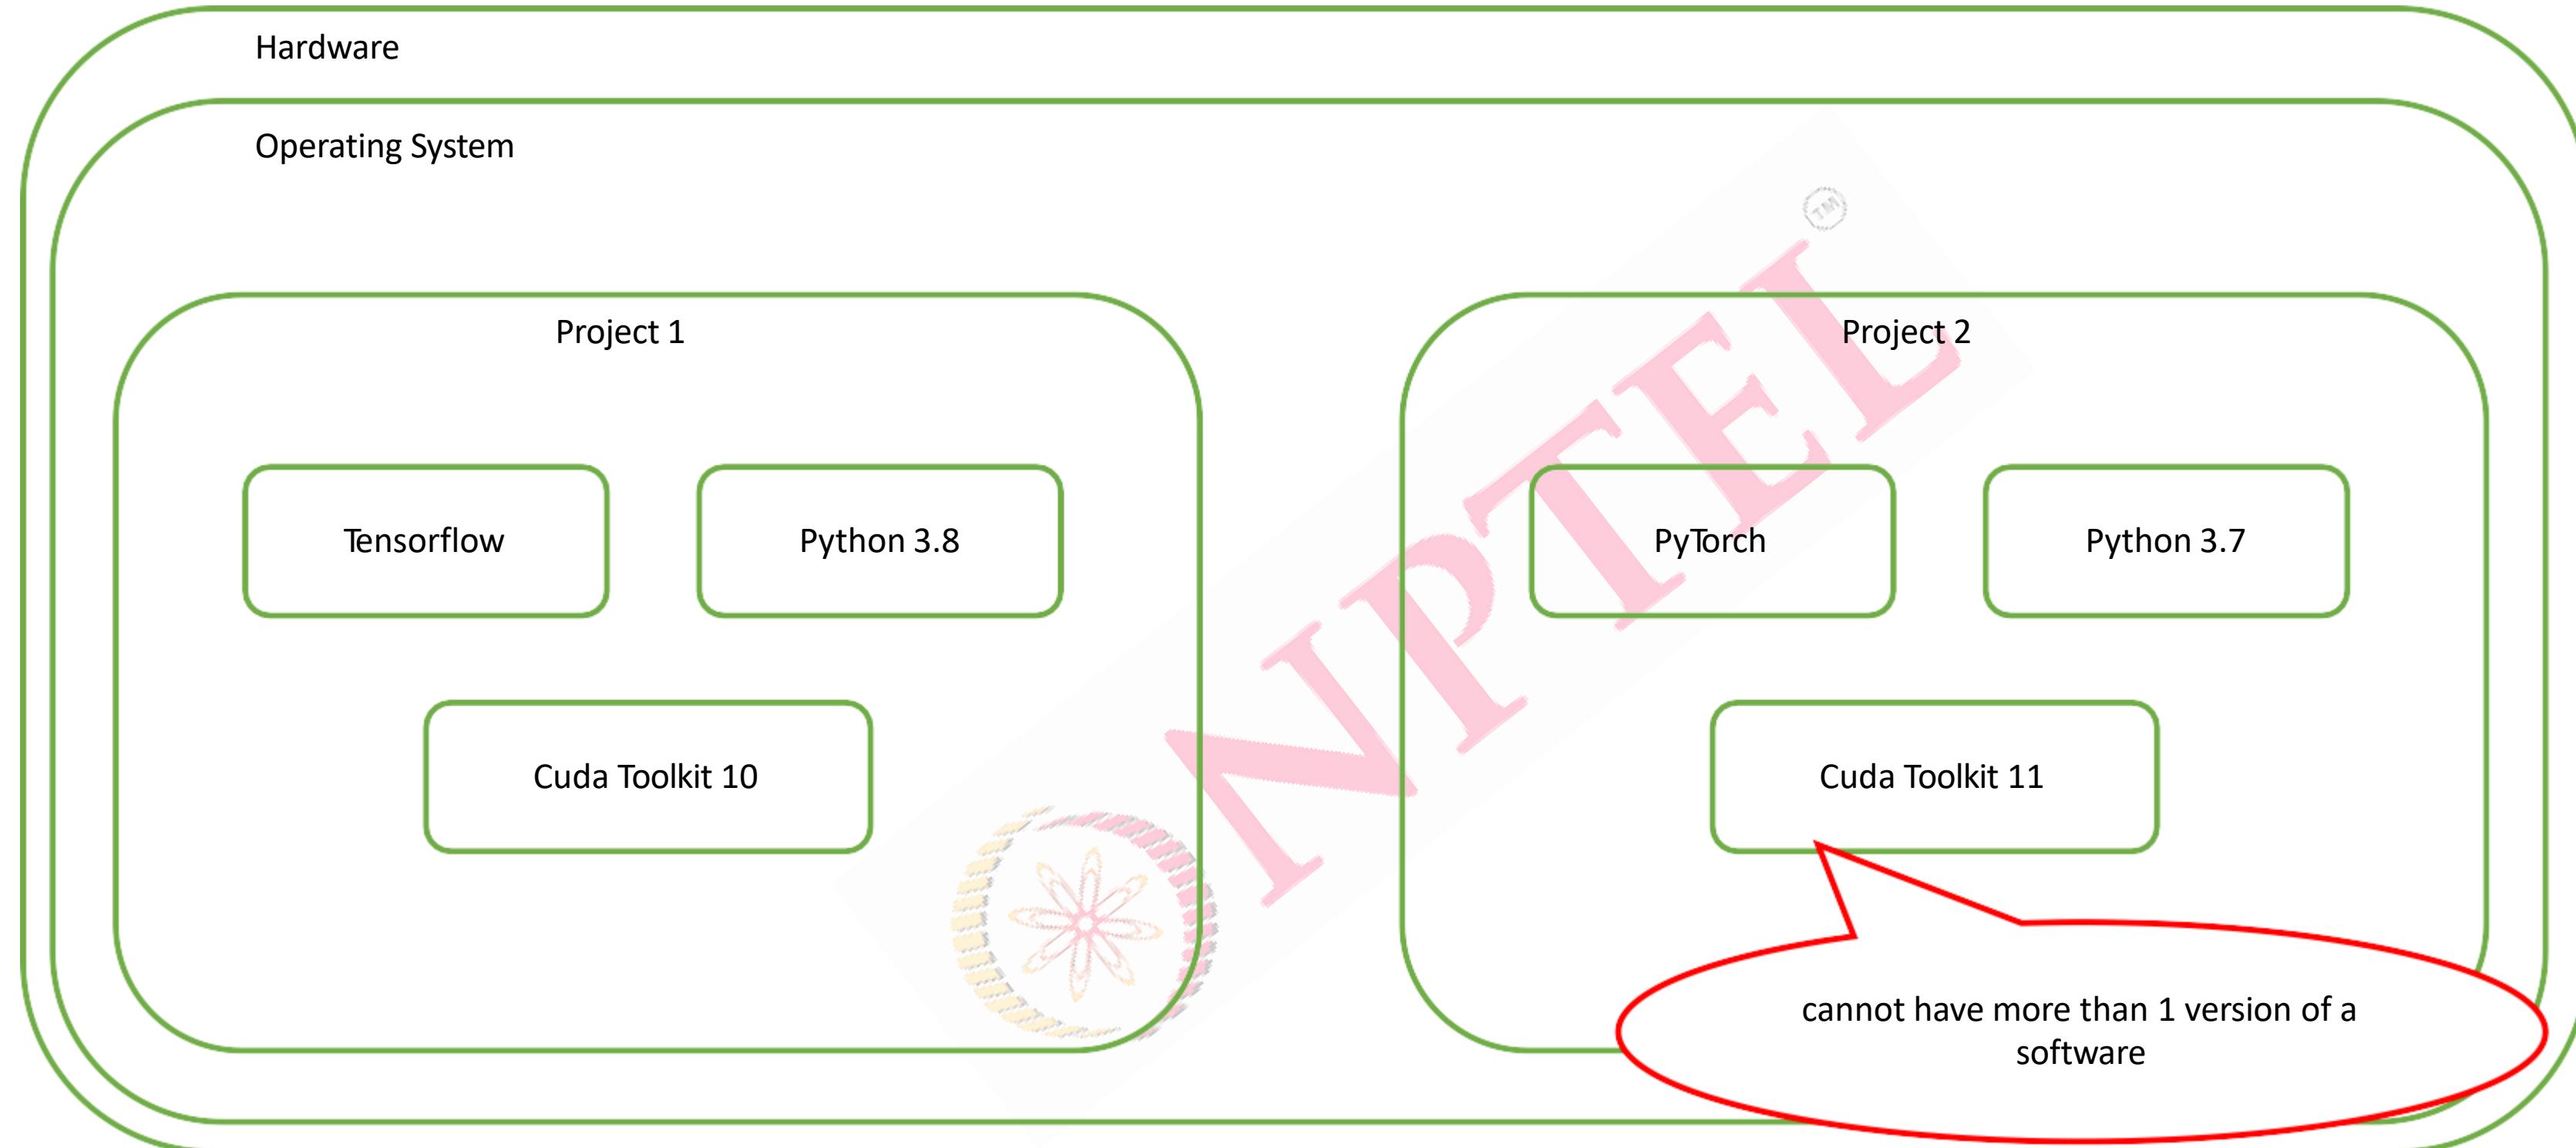

- Lot of software dependencies to handle.
- Access the same hardware with different frameworks and environments.
- Deployment and version control problems

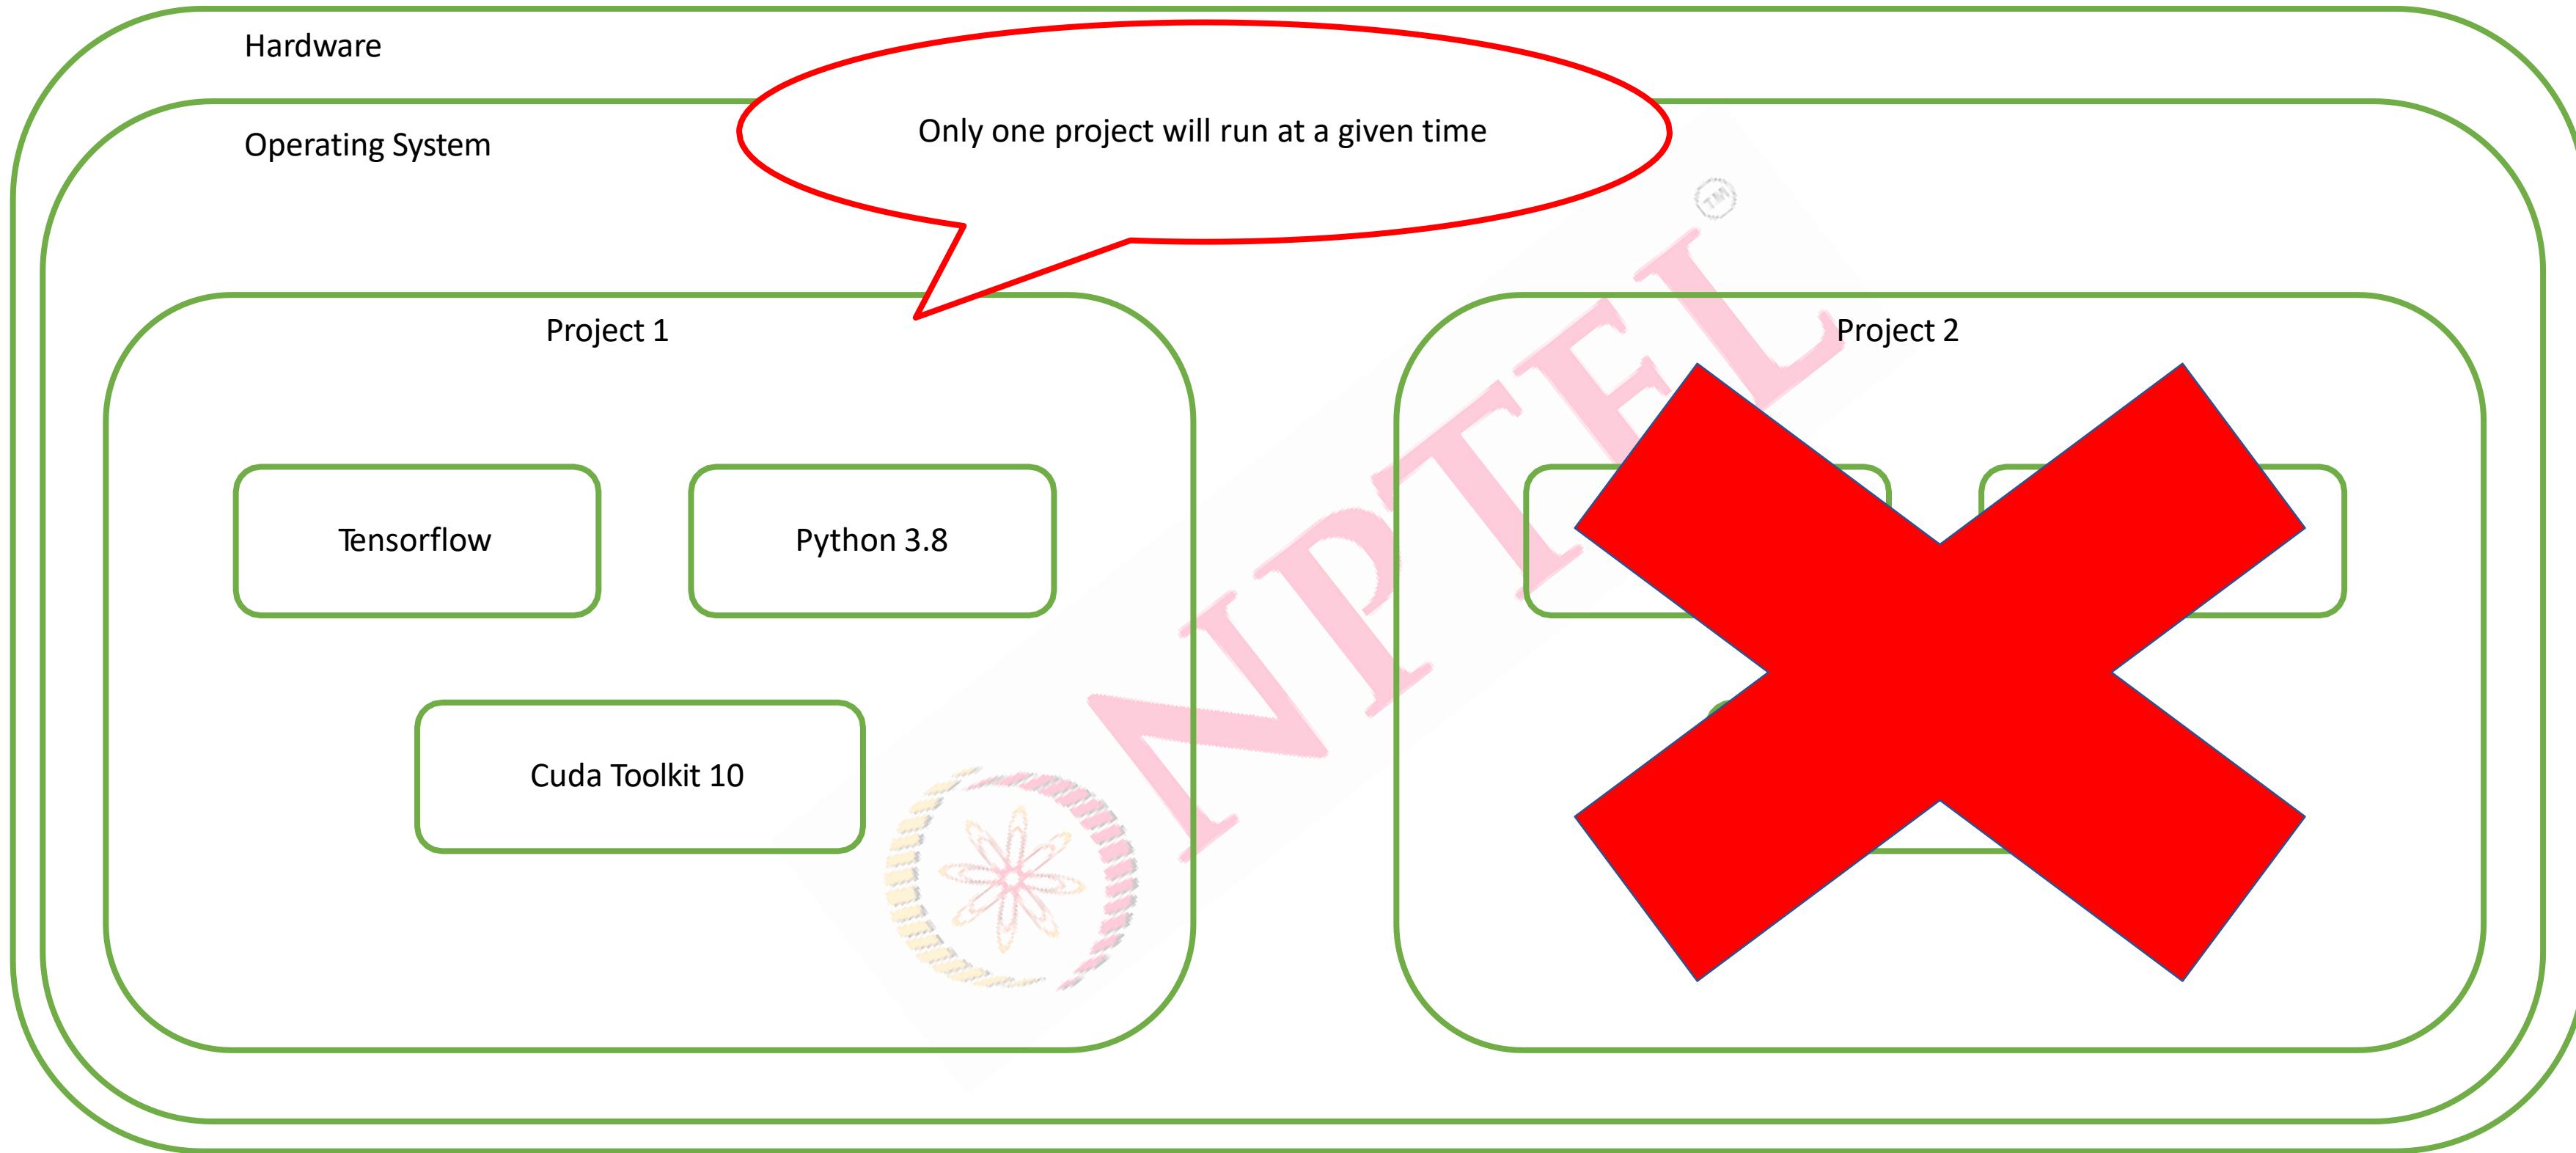

Dependency problem

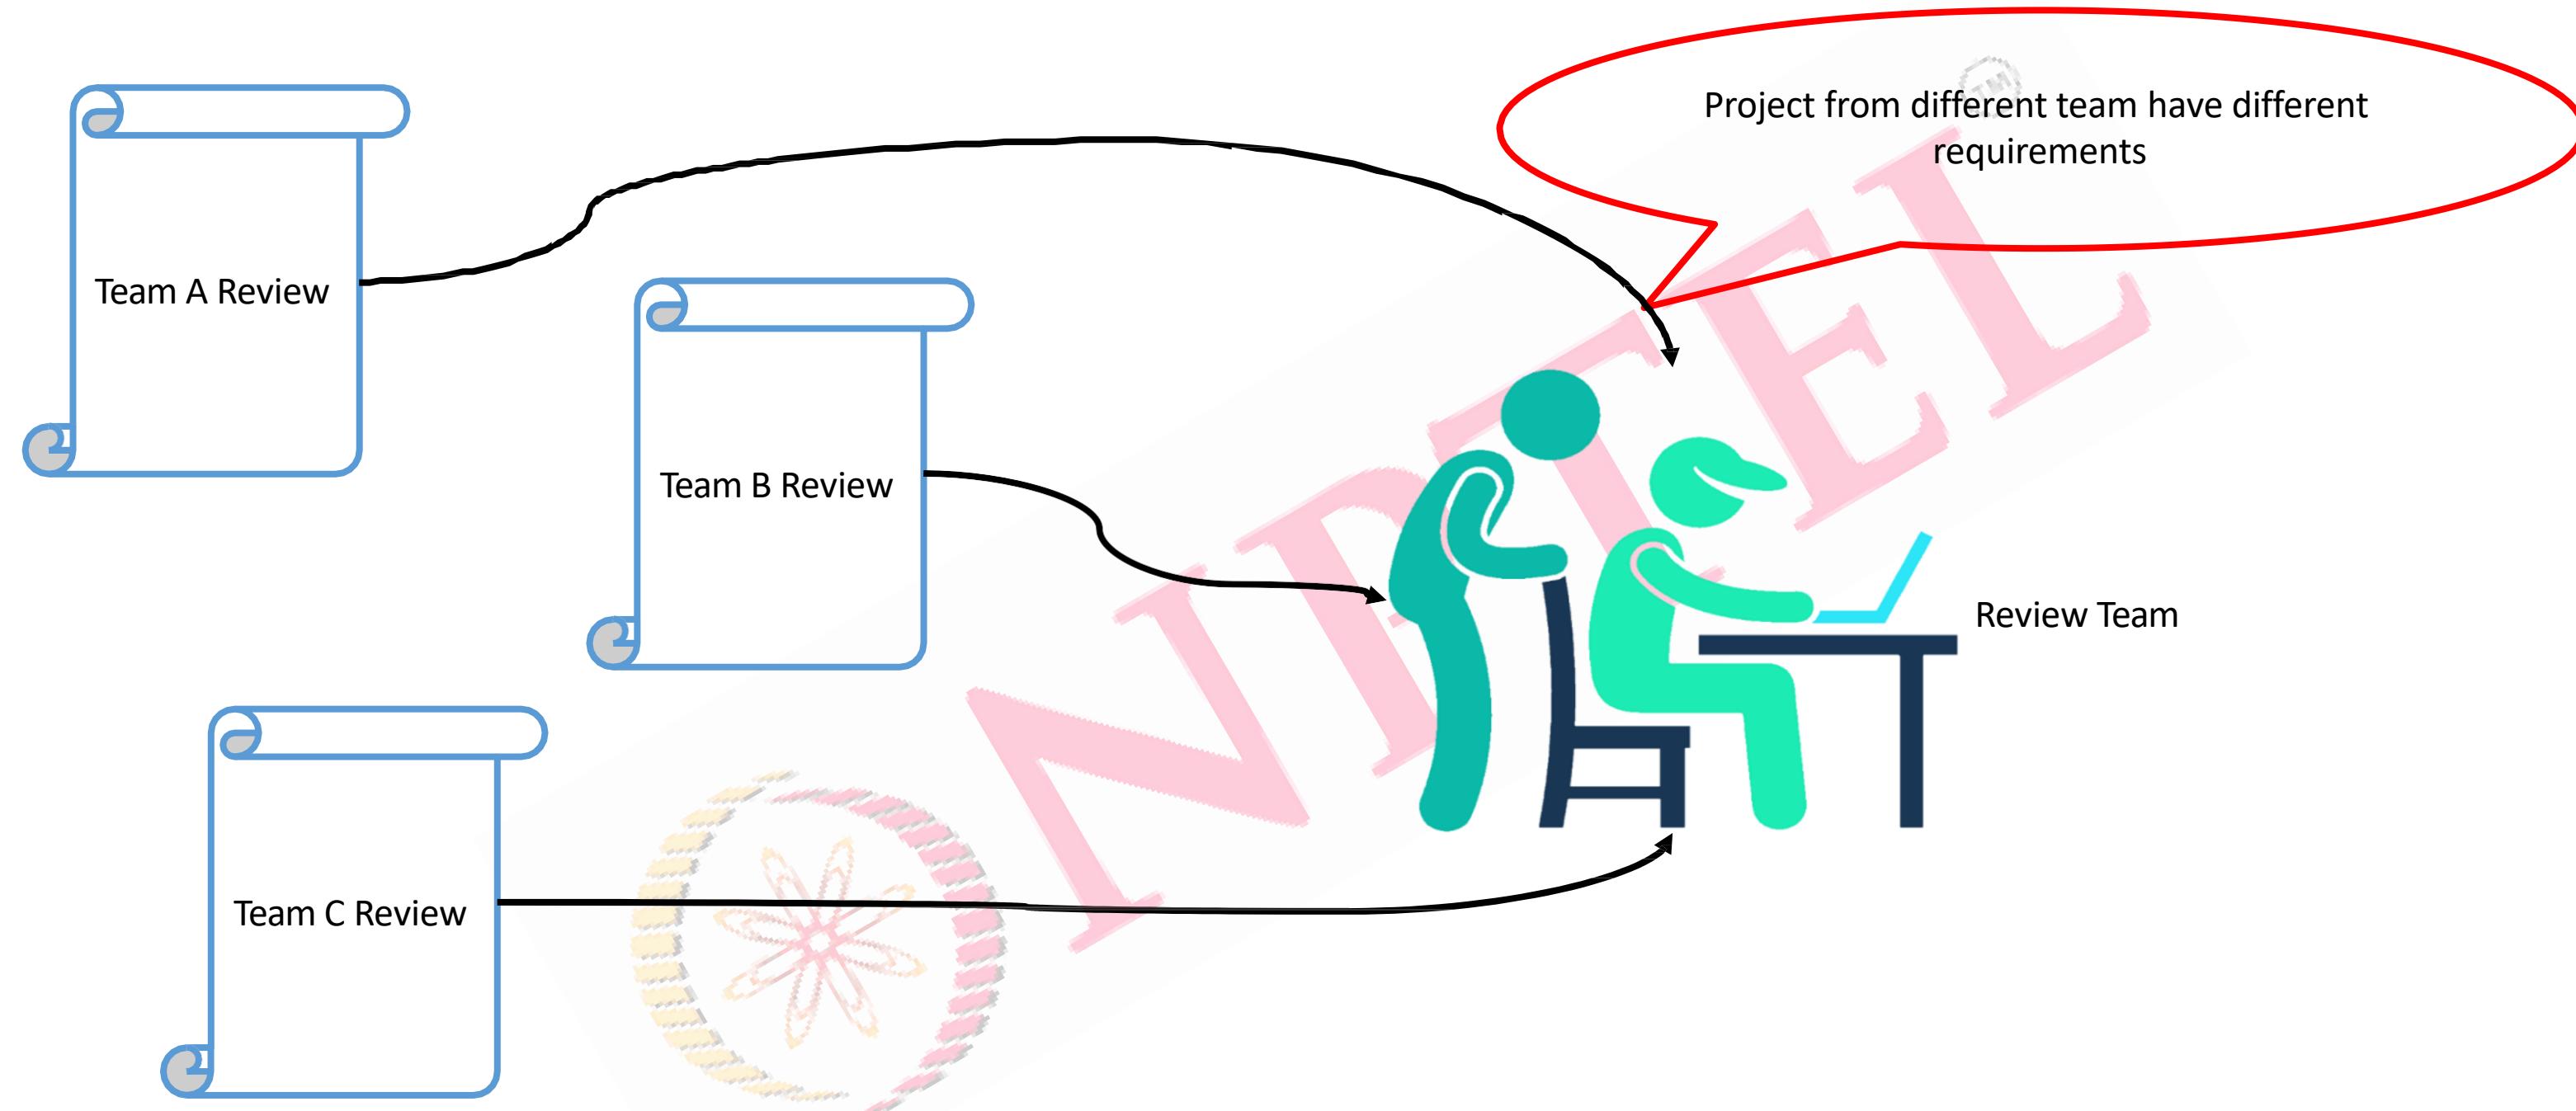

Dependency problem

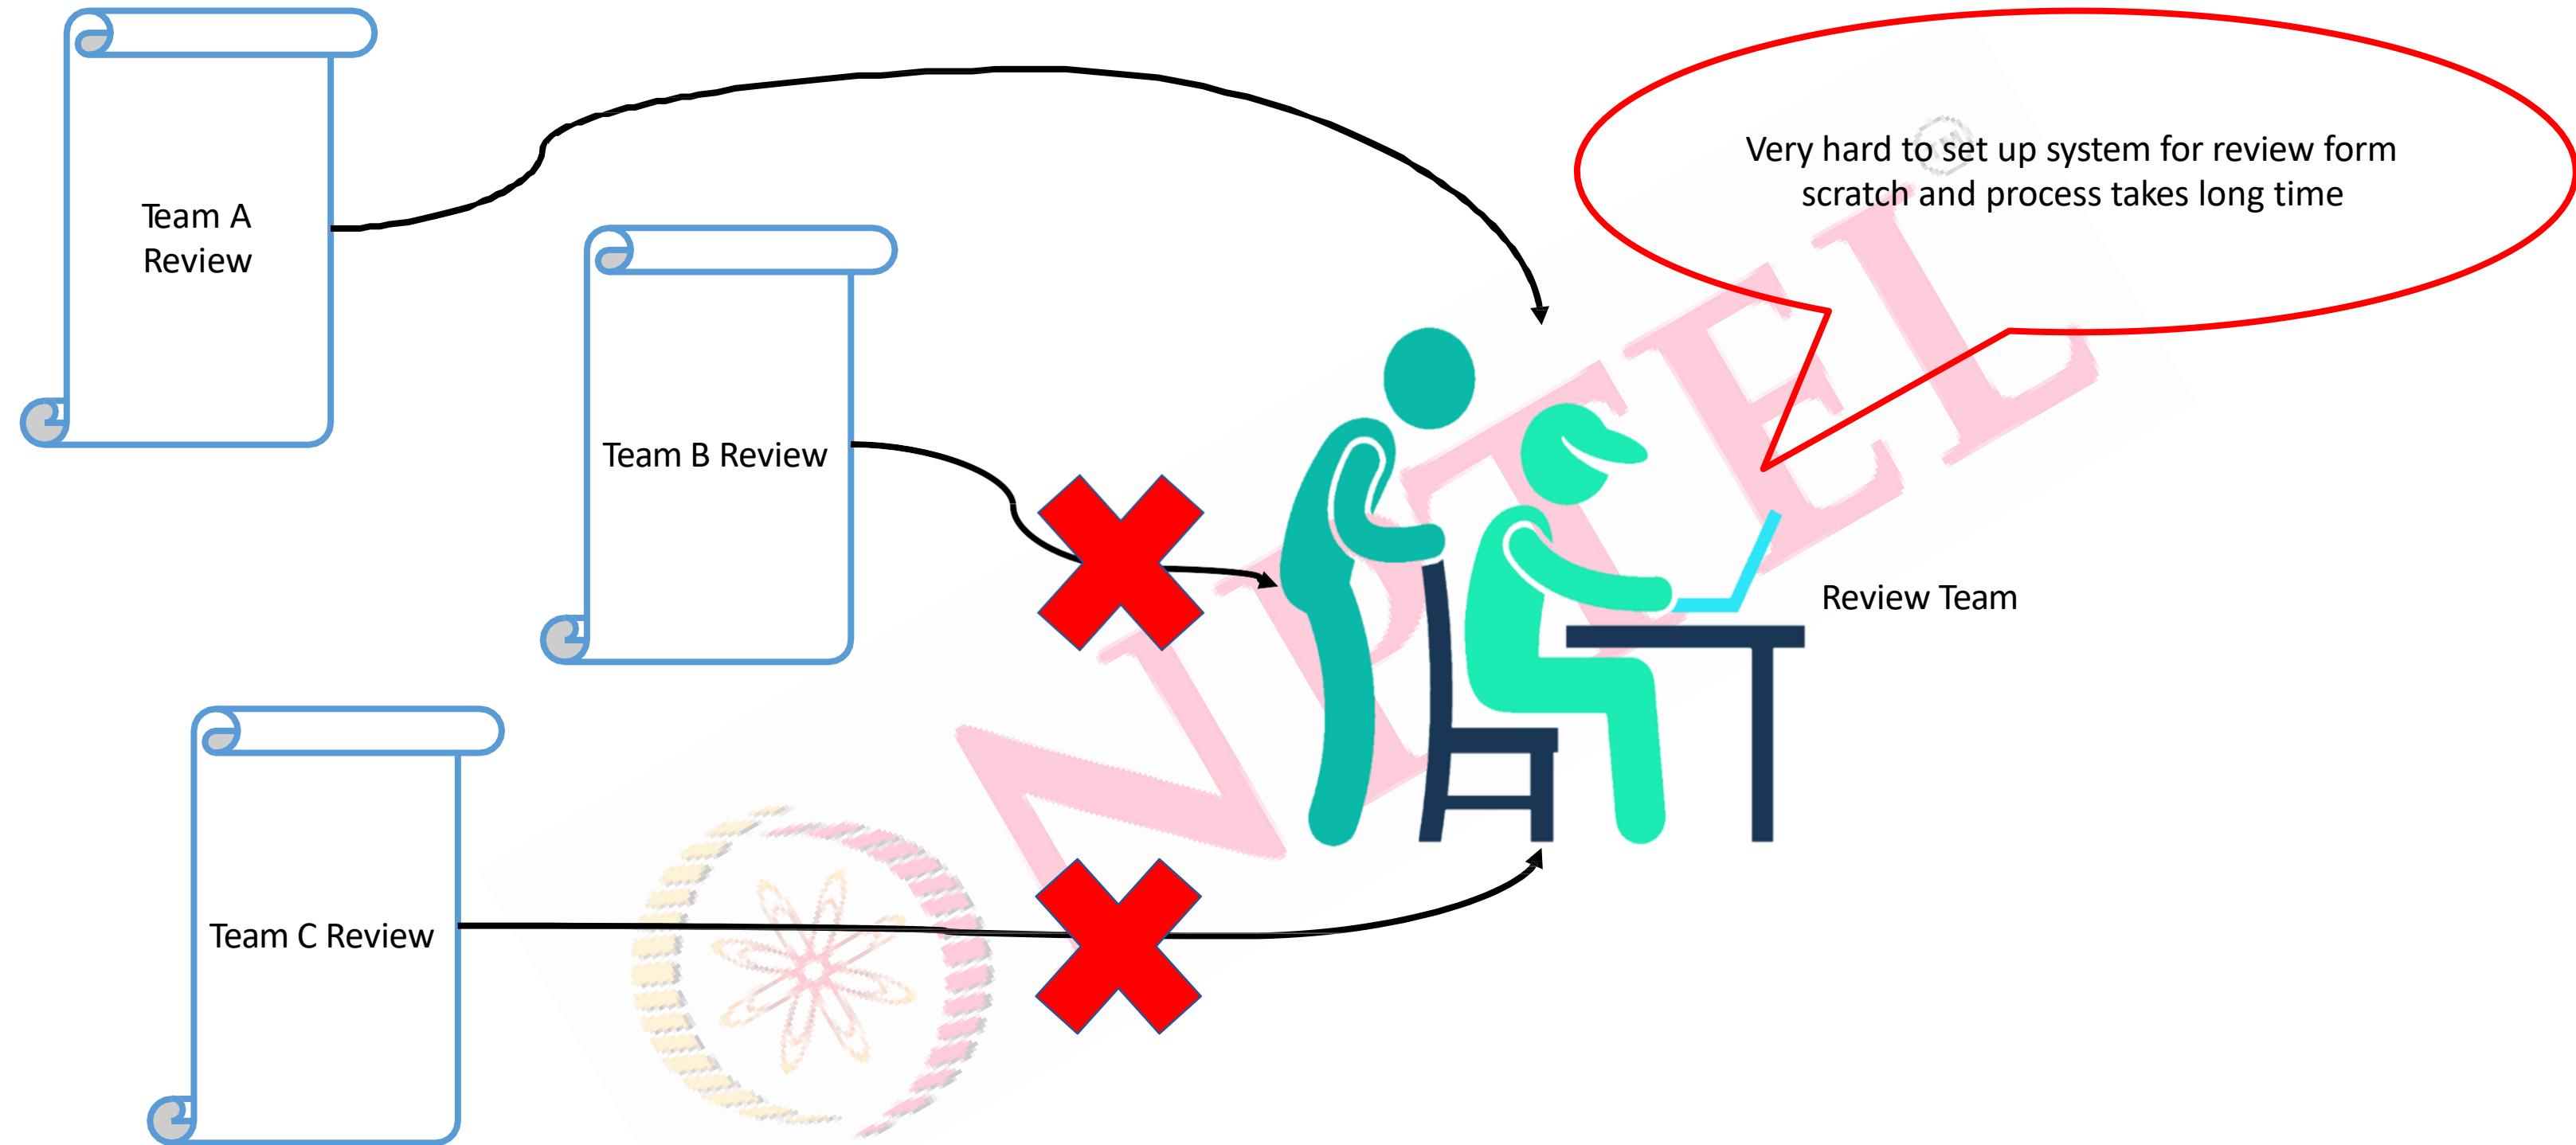

Dependency problem

Problems of Version control

Problems of Version control

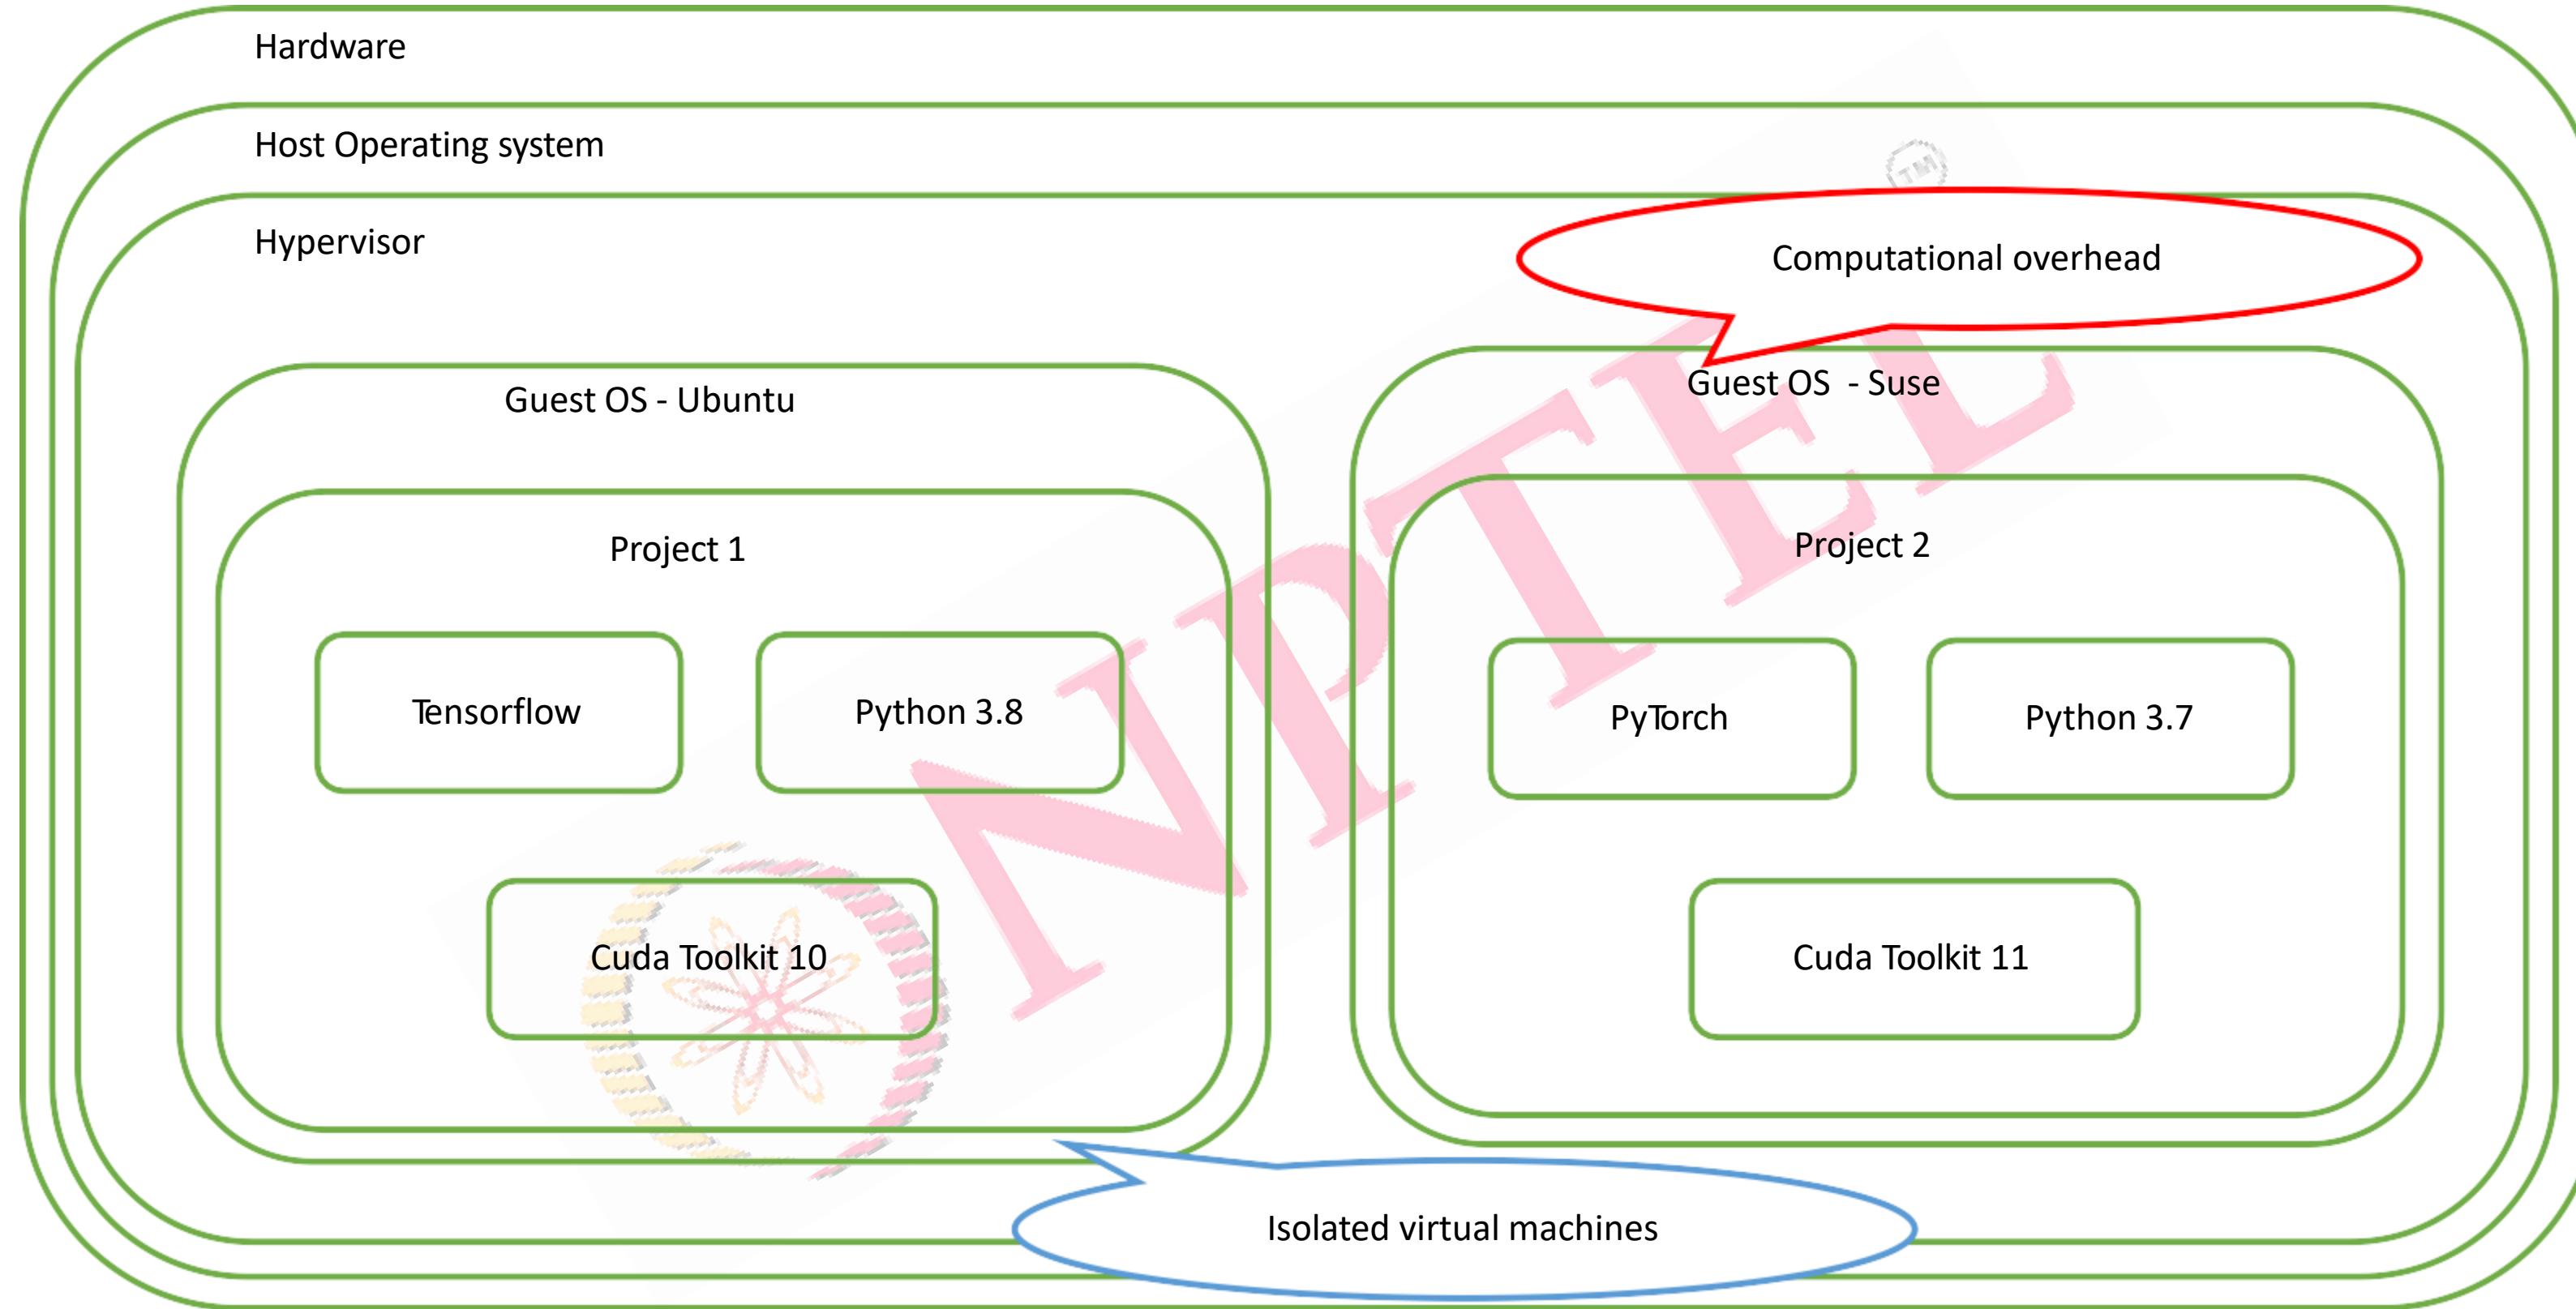

Possible Solutions

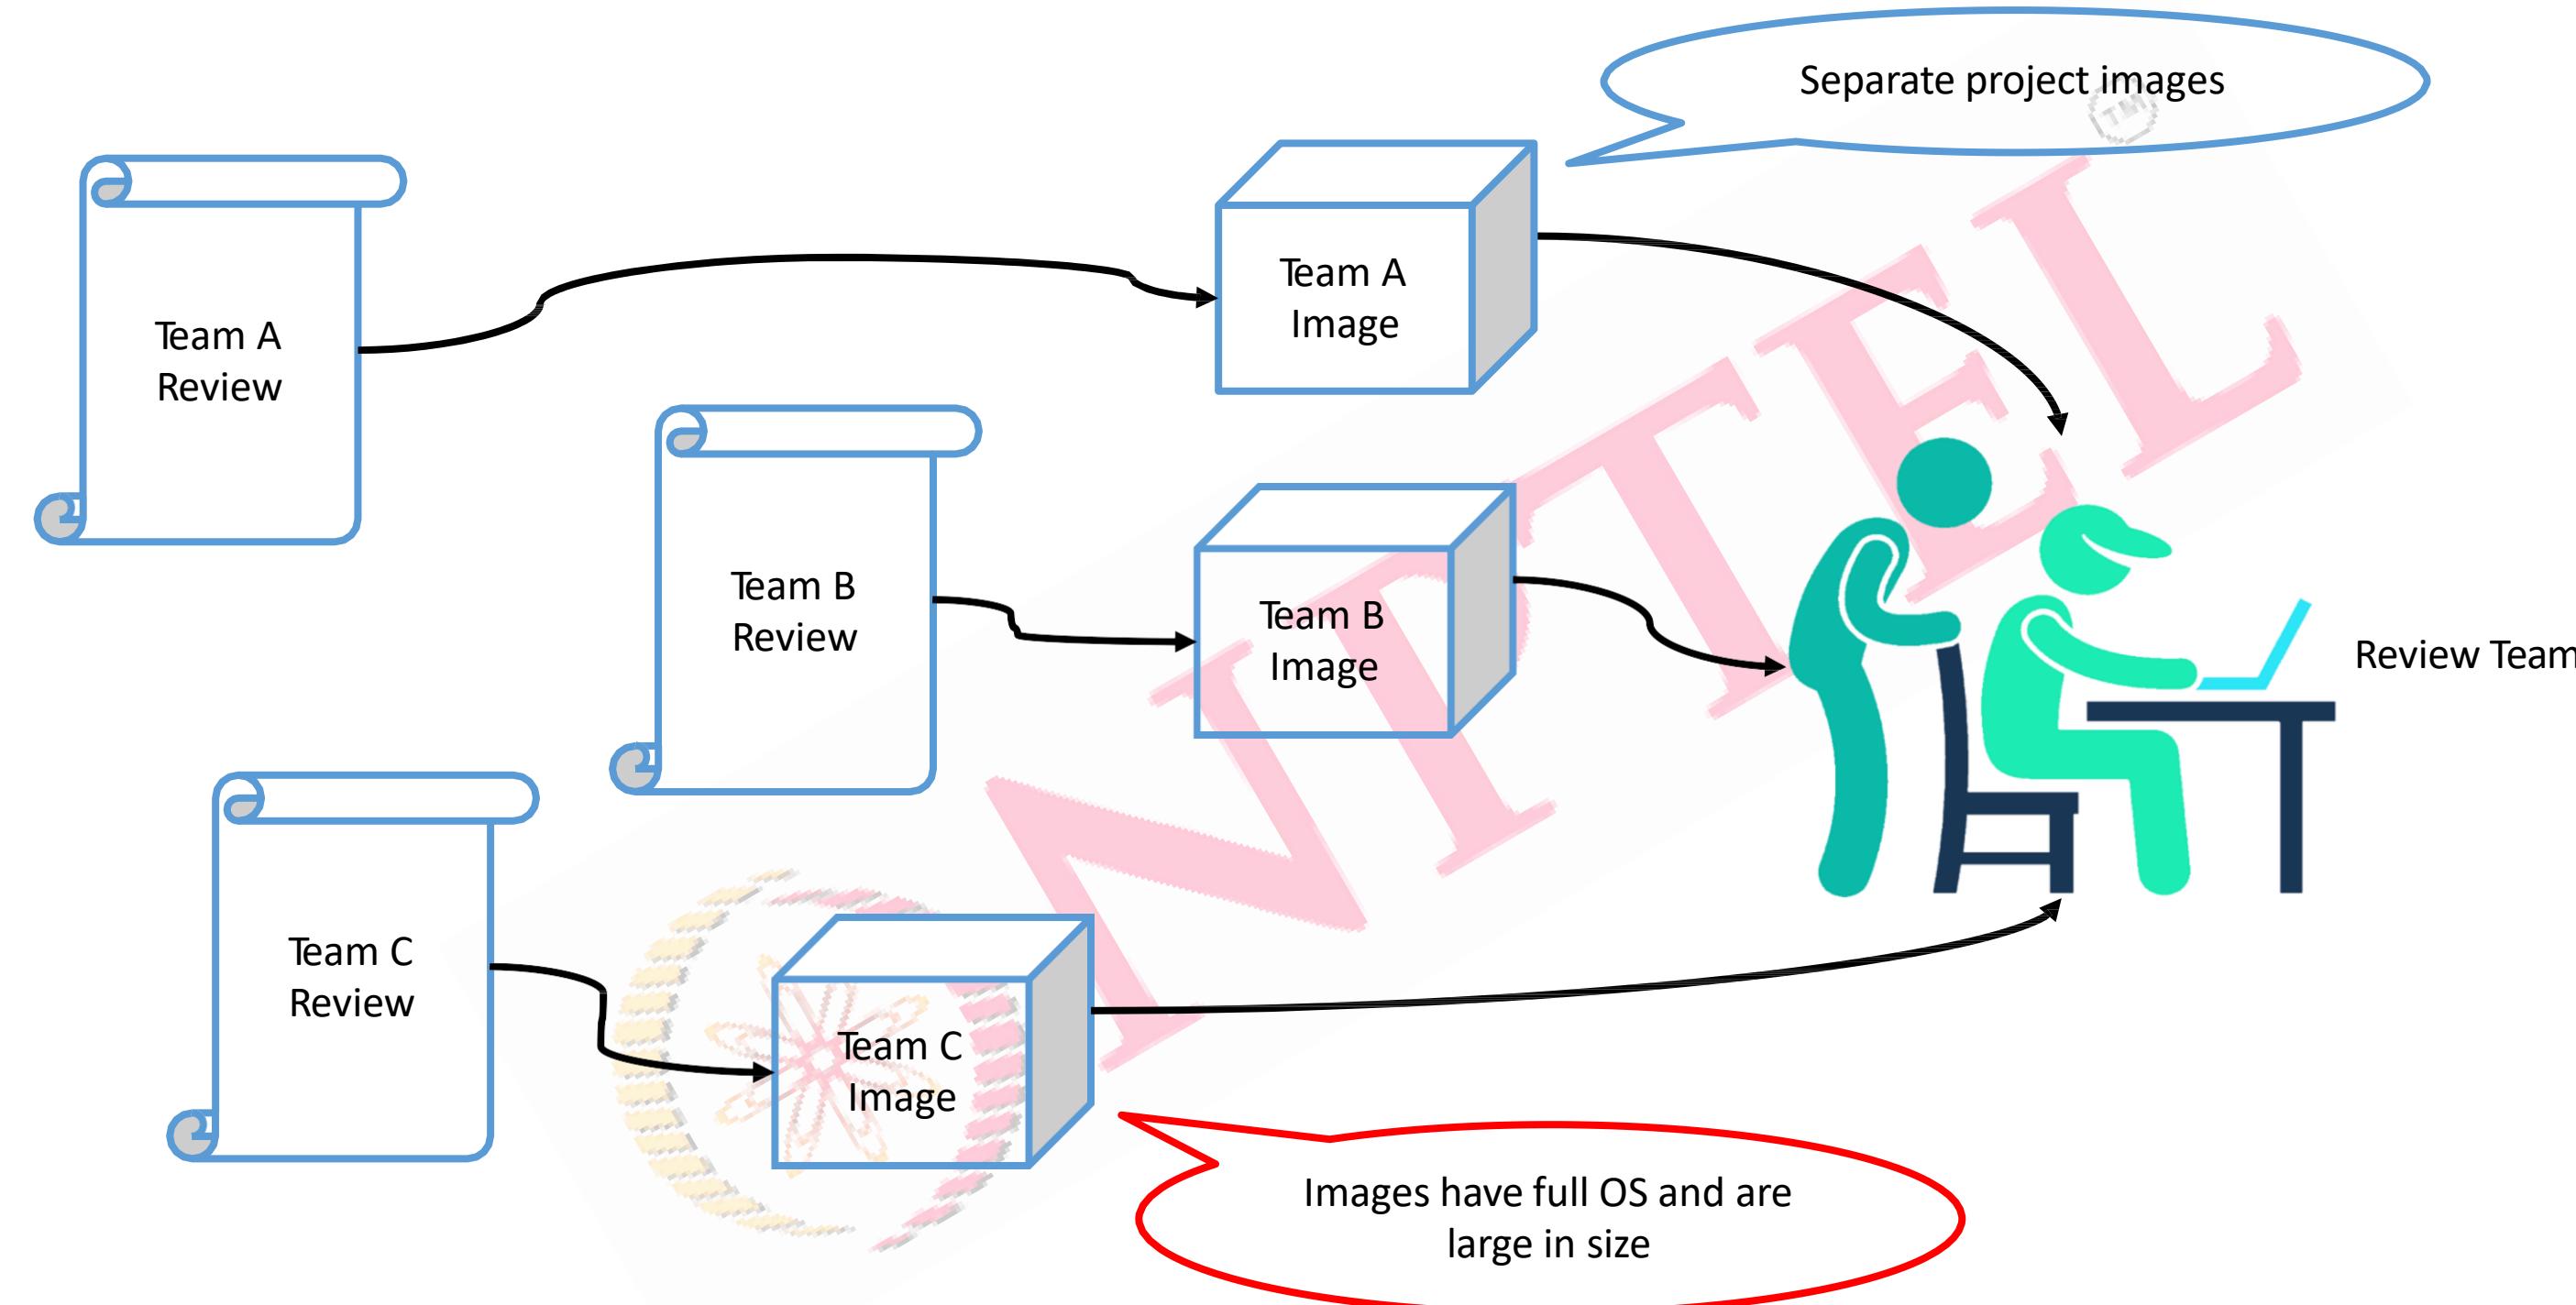

1. Virtual machine
2. Docker and Containers

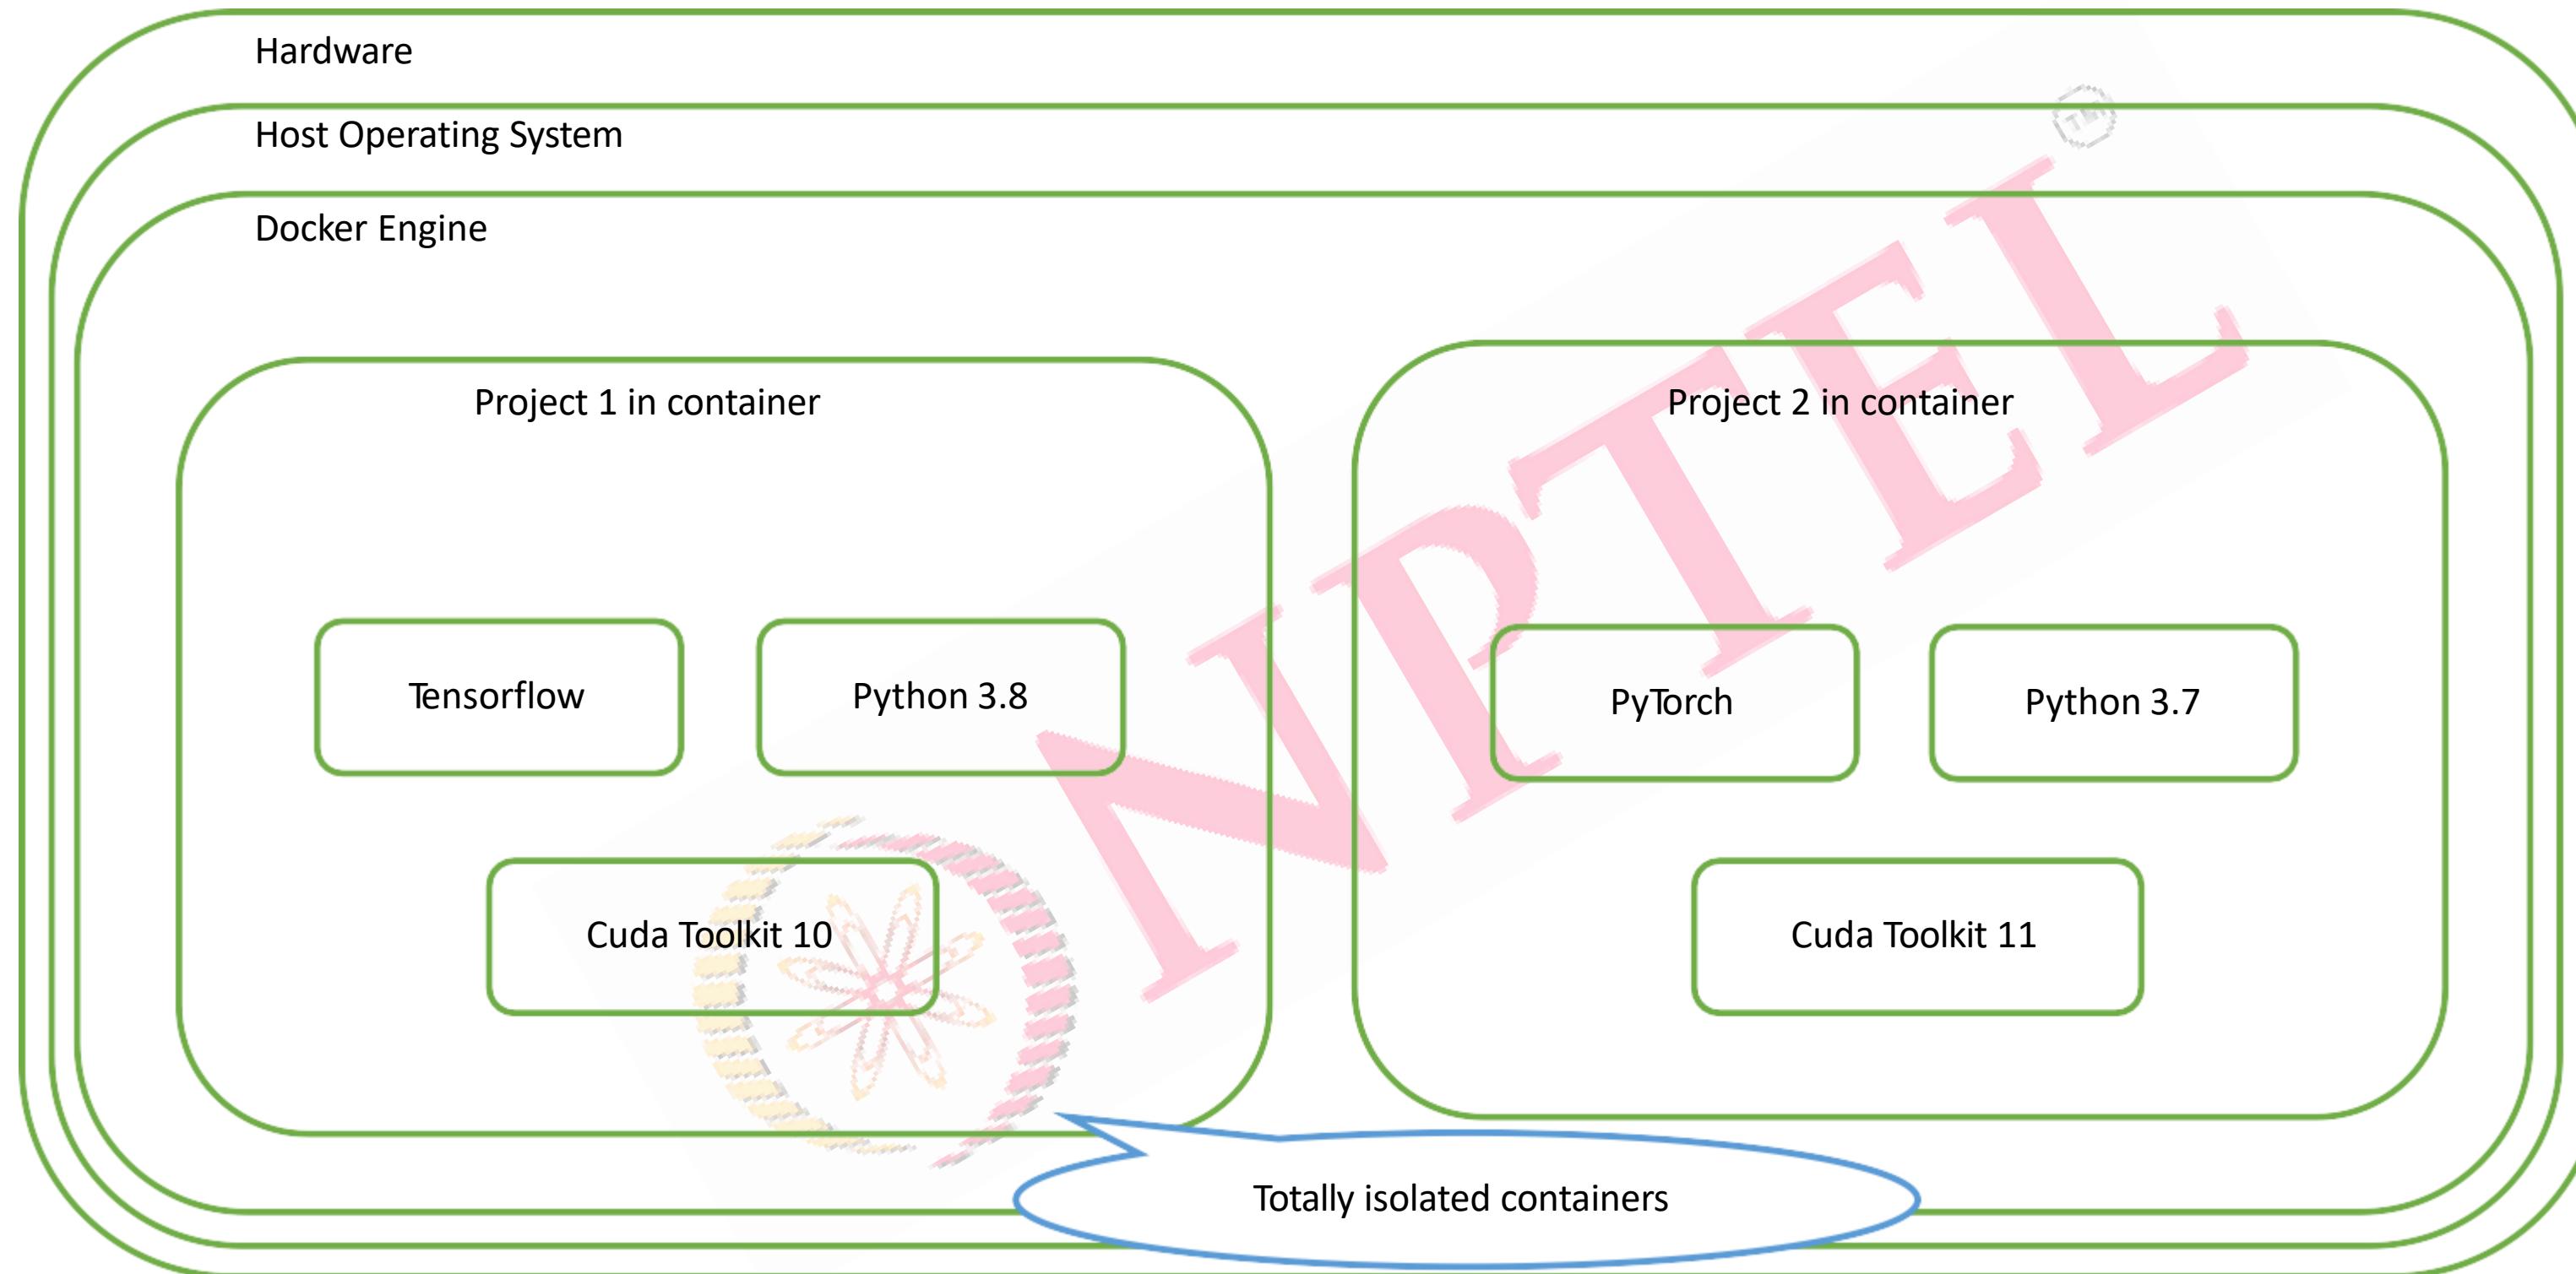

Virtual Machine – Solution

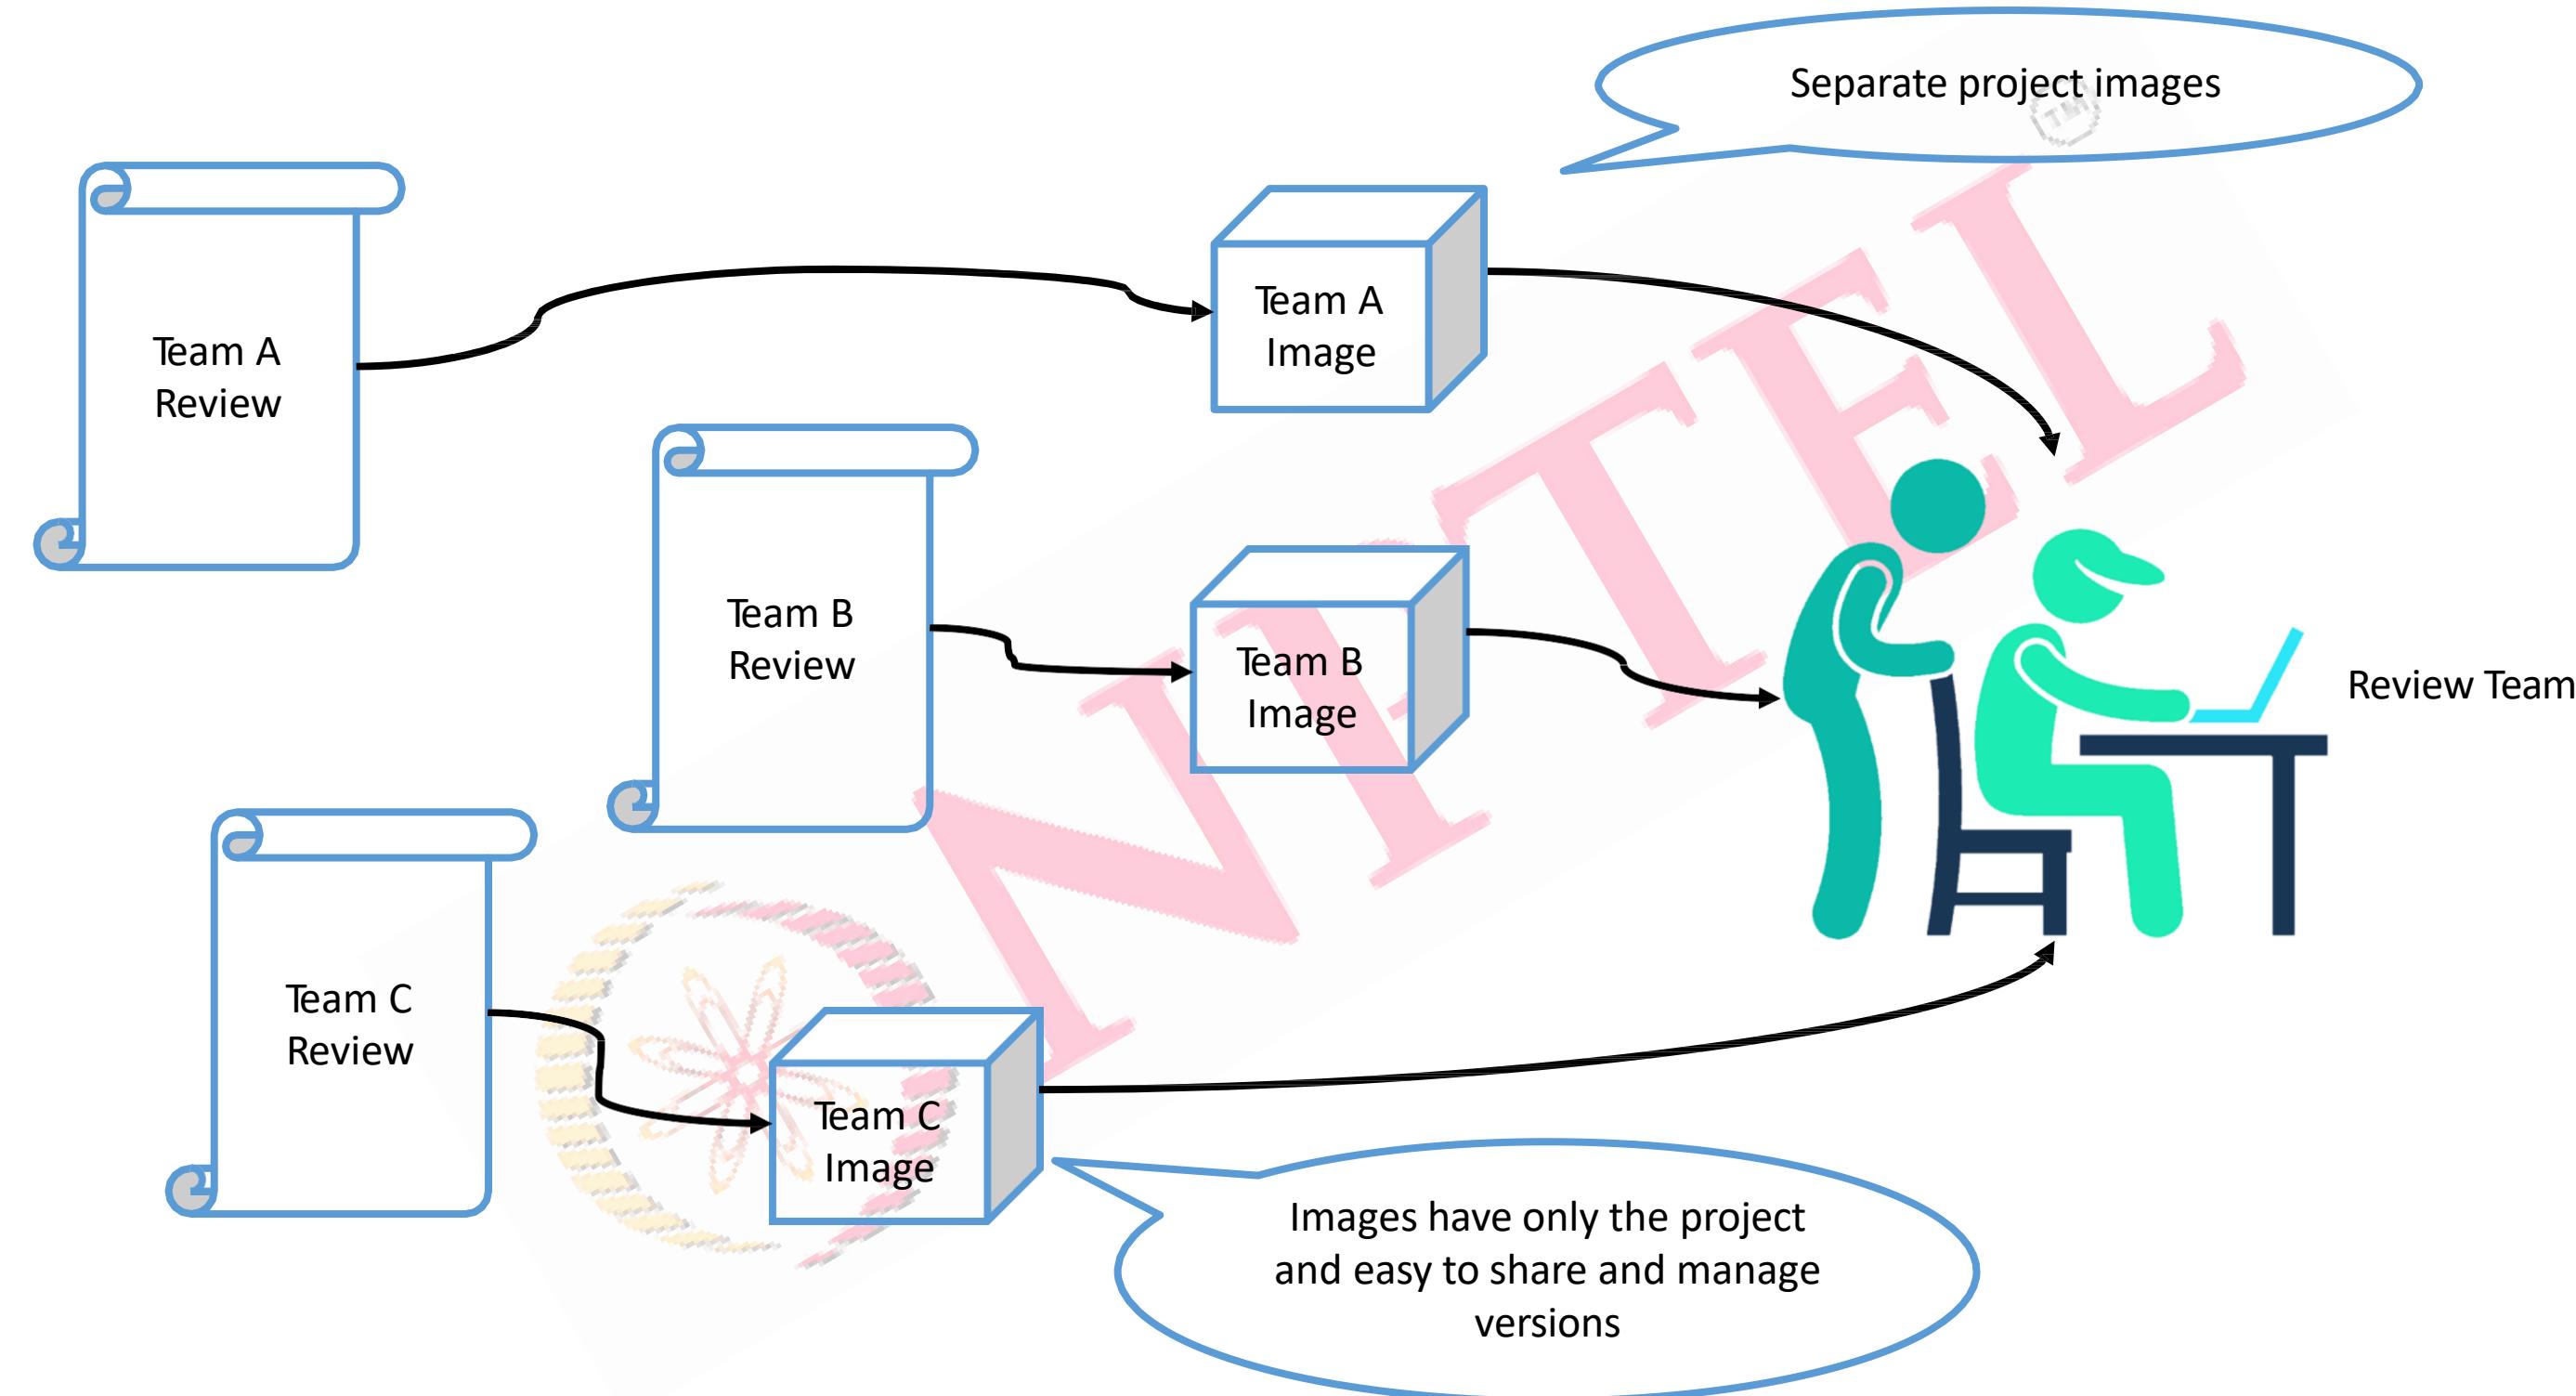

Version control – Virtual Machine Solution

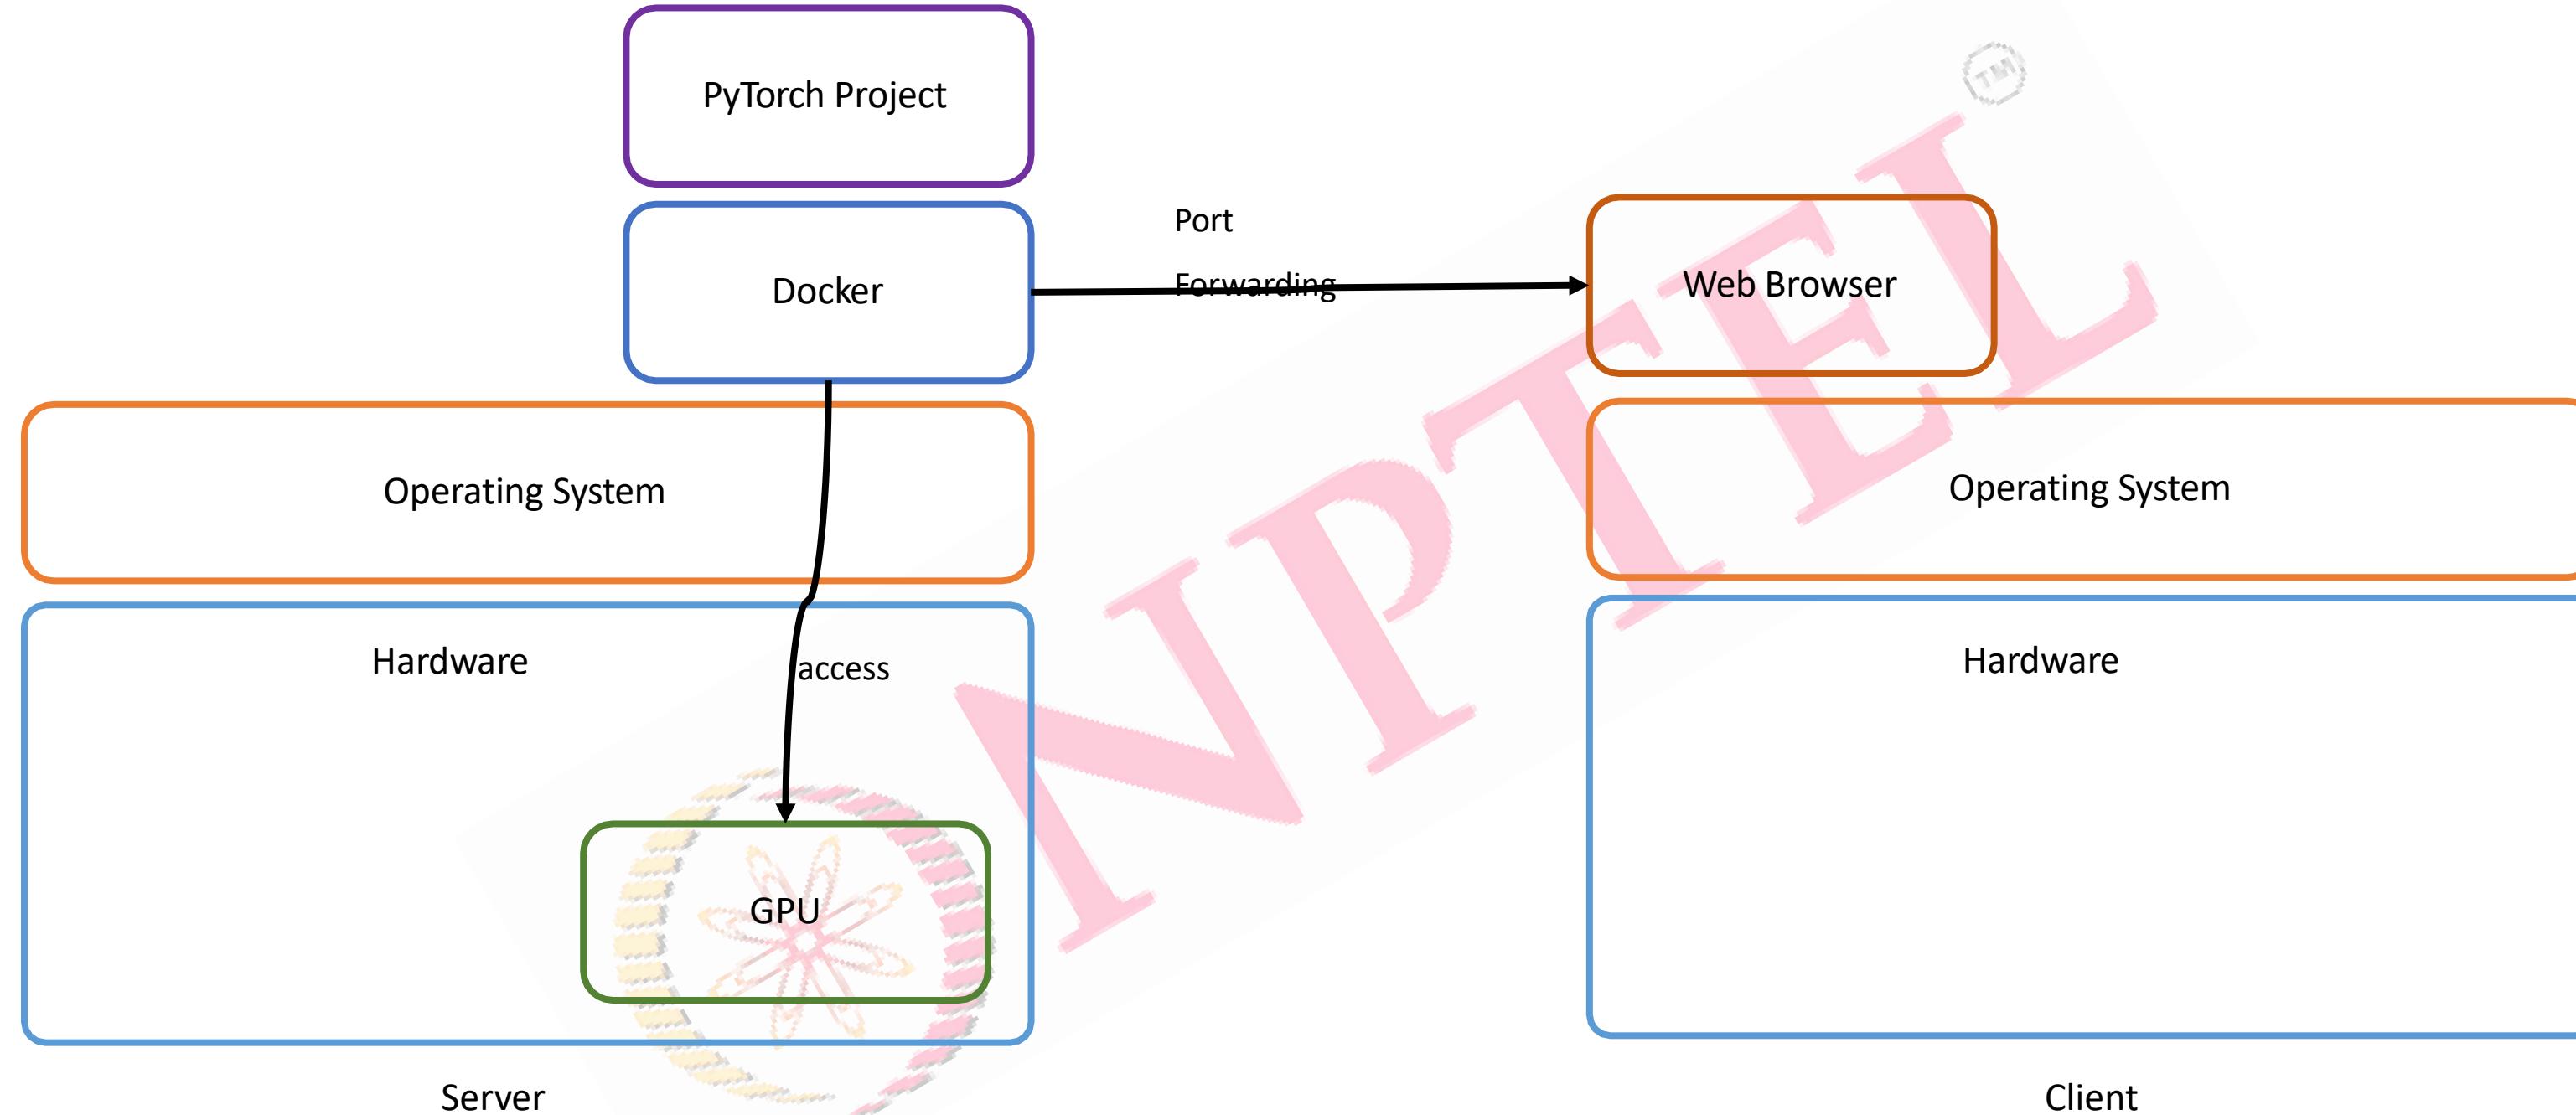

Dockers – Solution

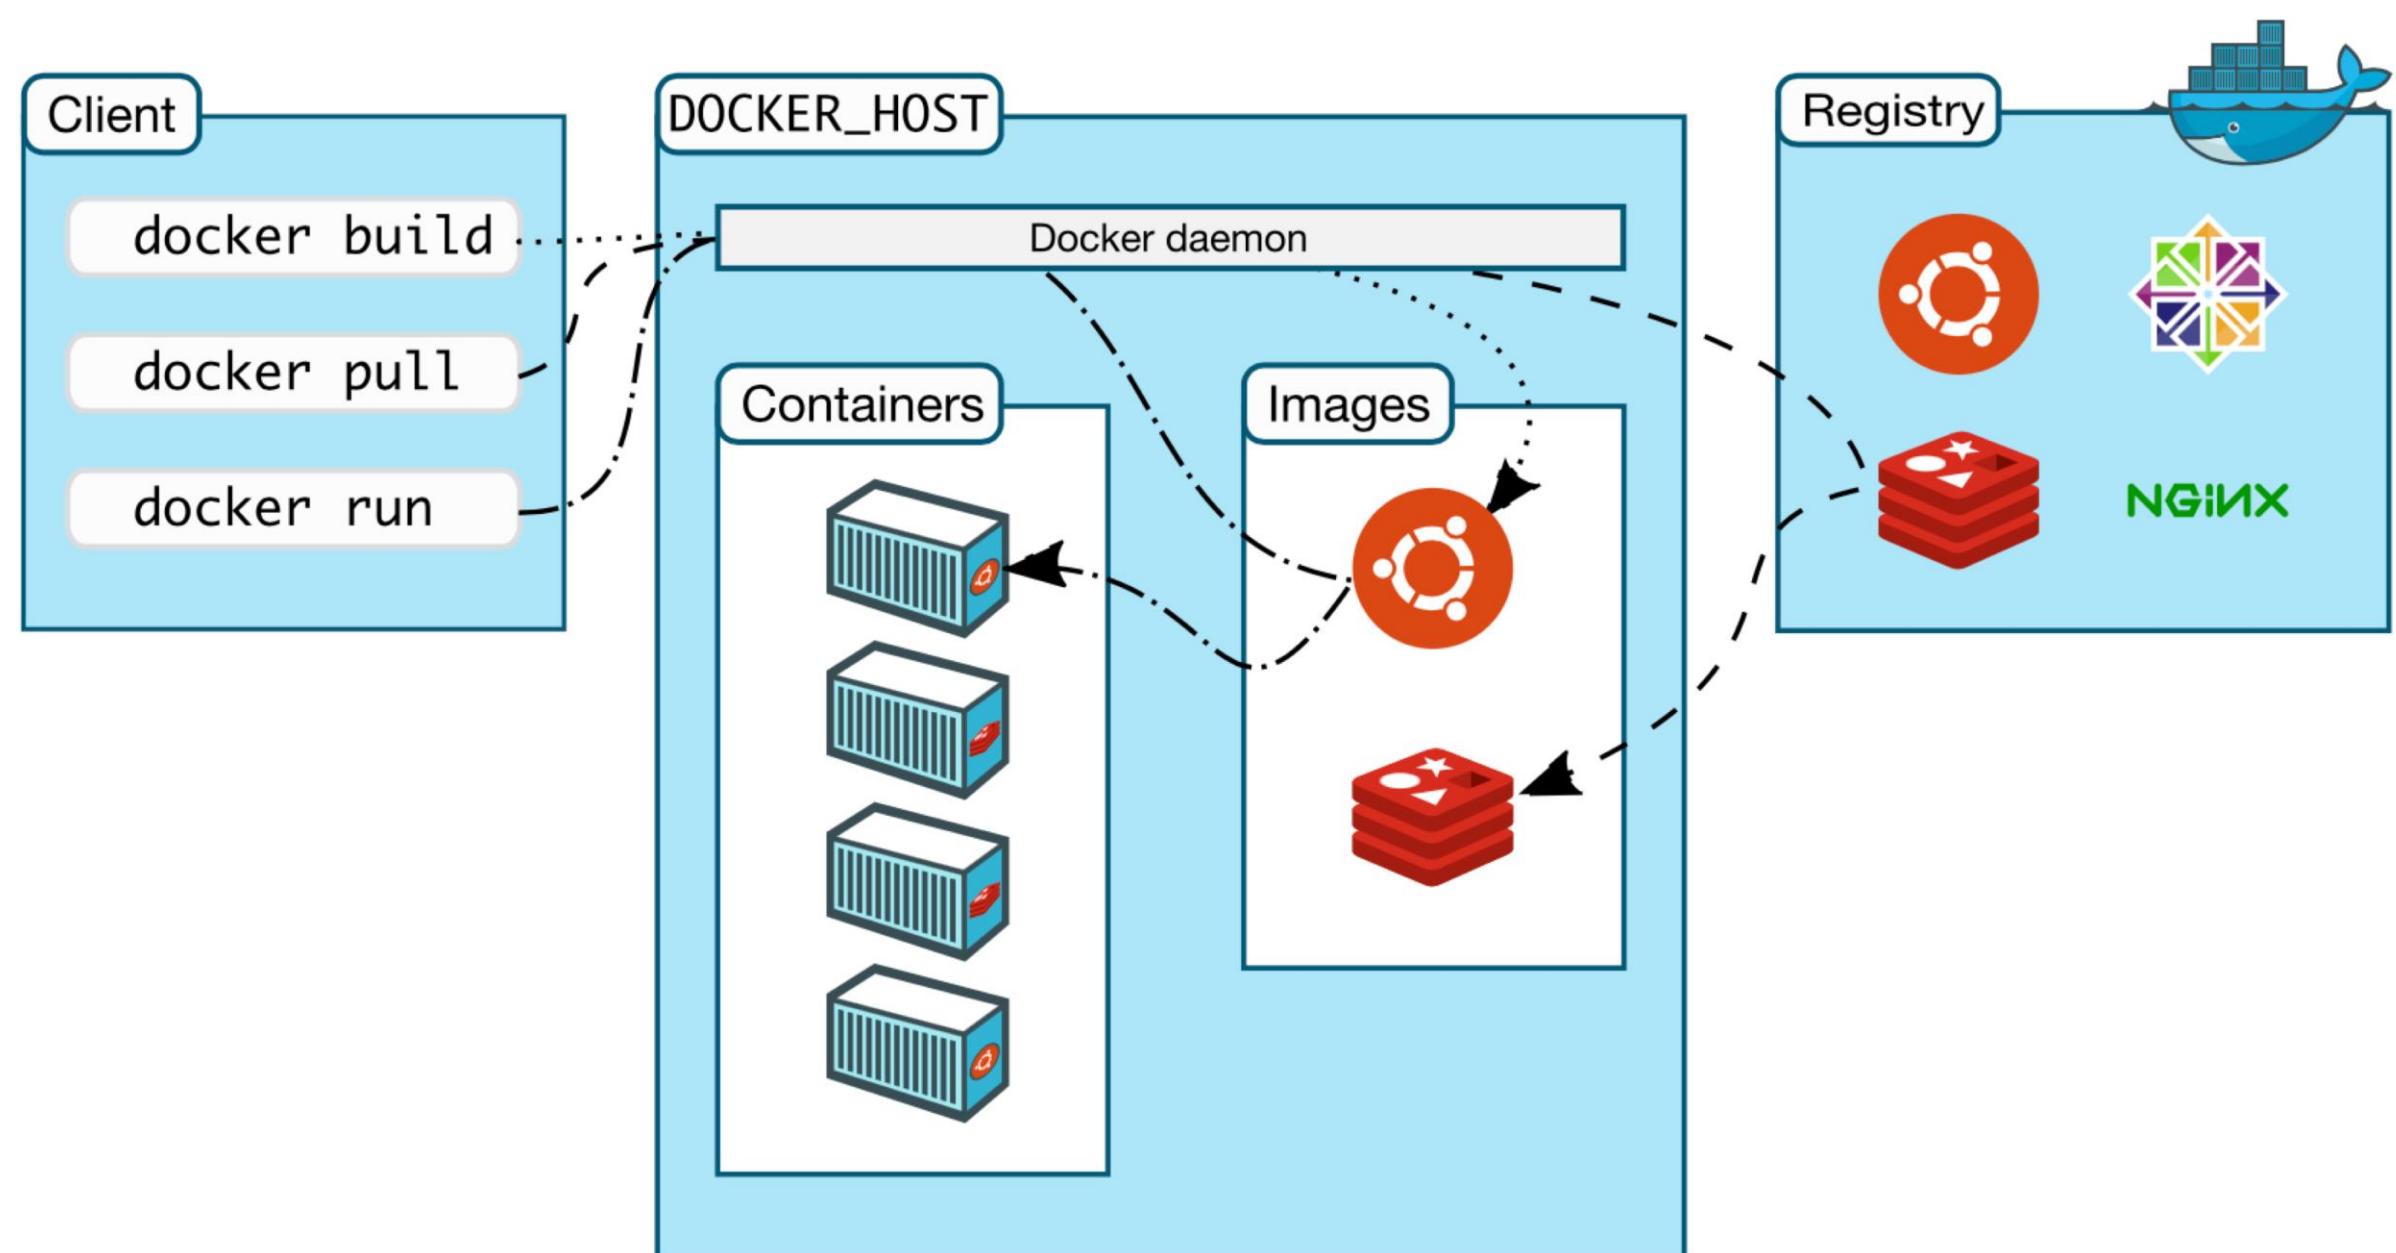

Version control – Dockers Solution

Dockers Access – GPU

Dockers

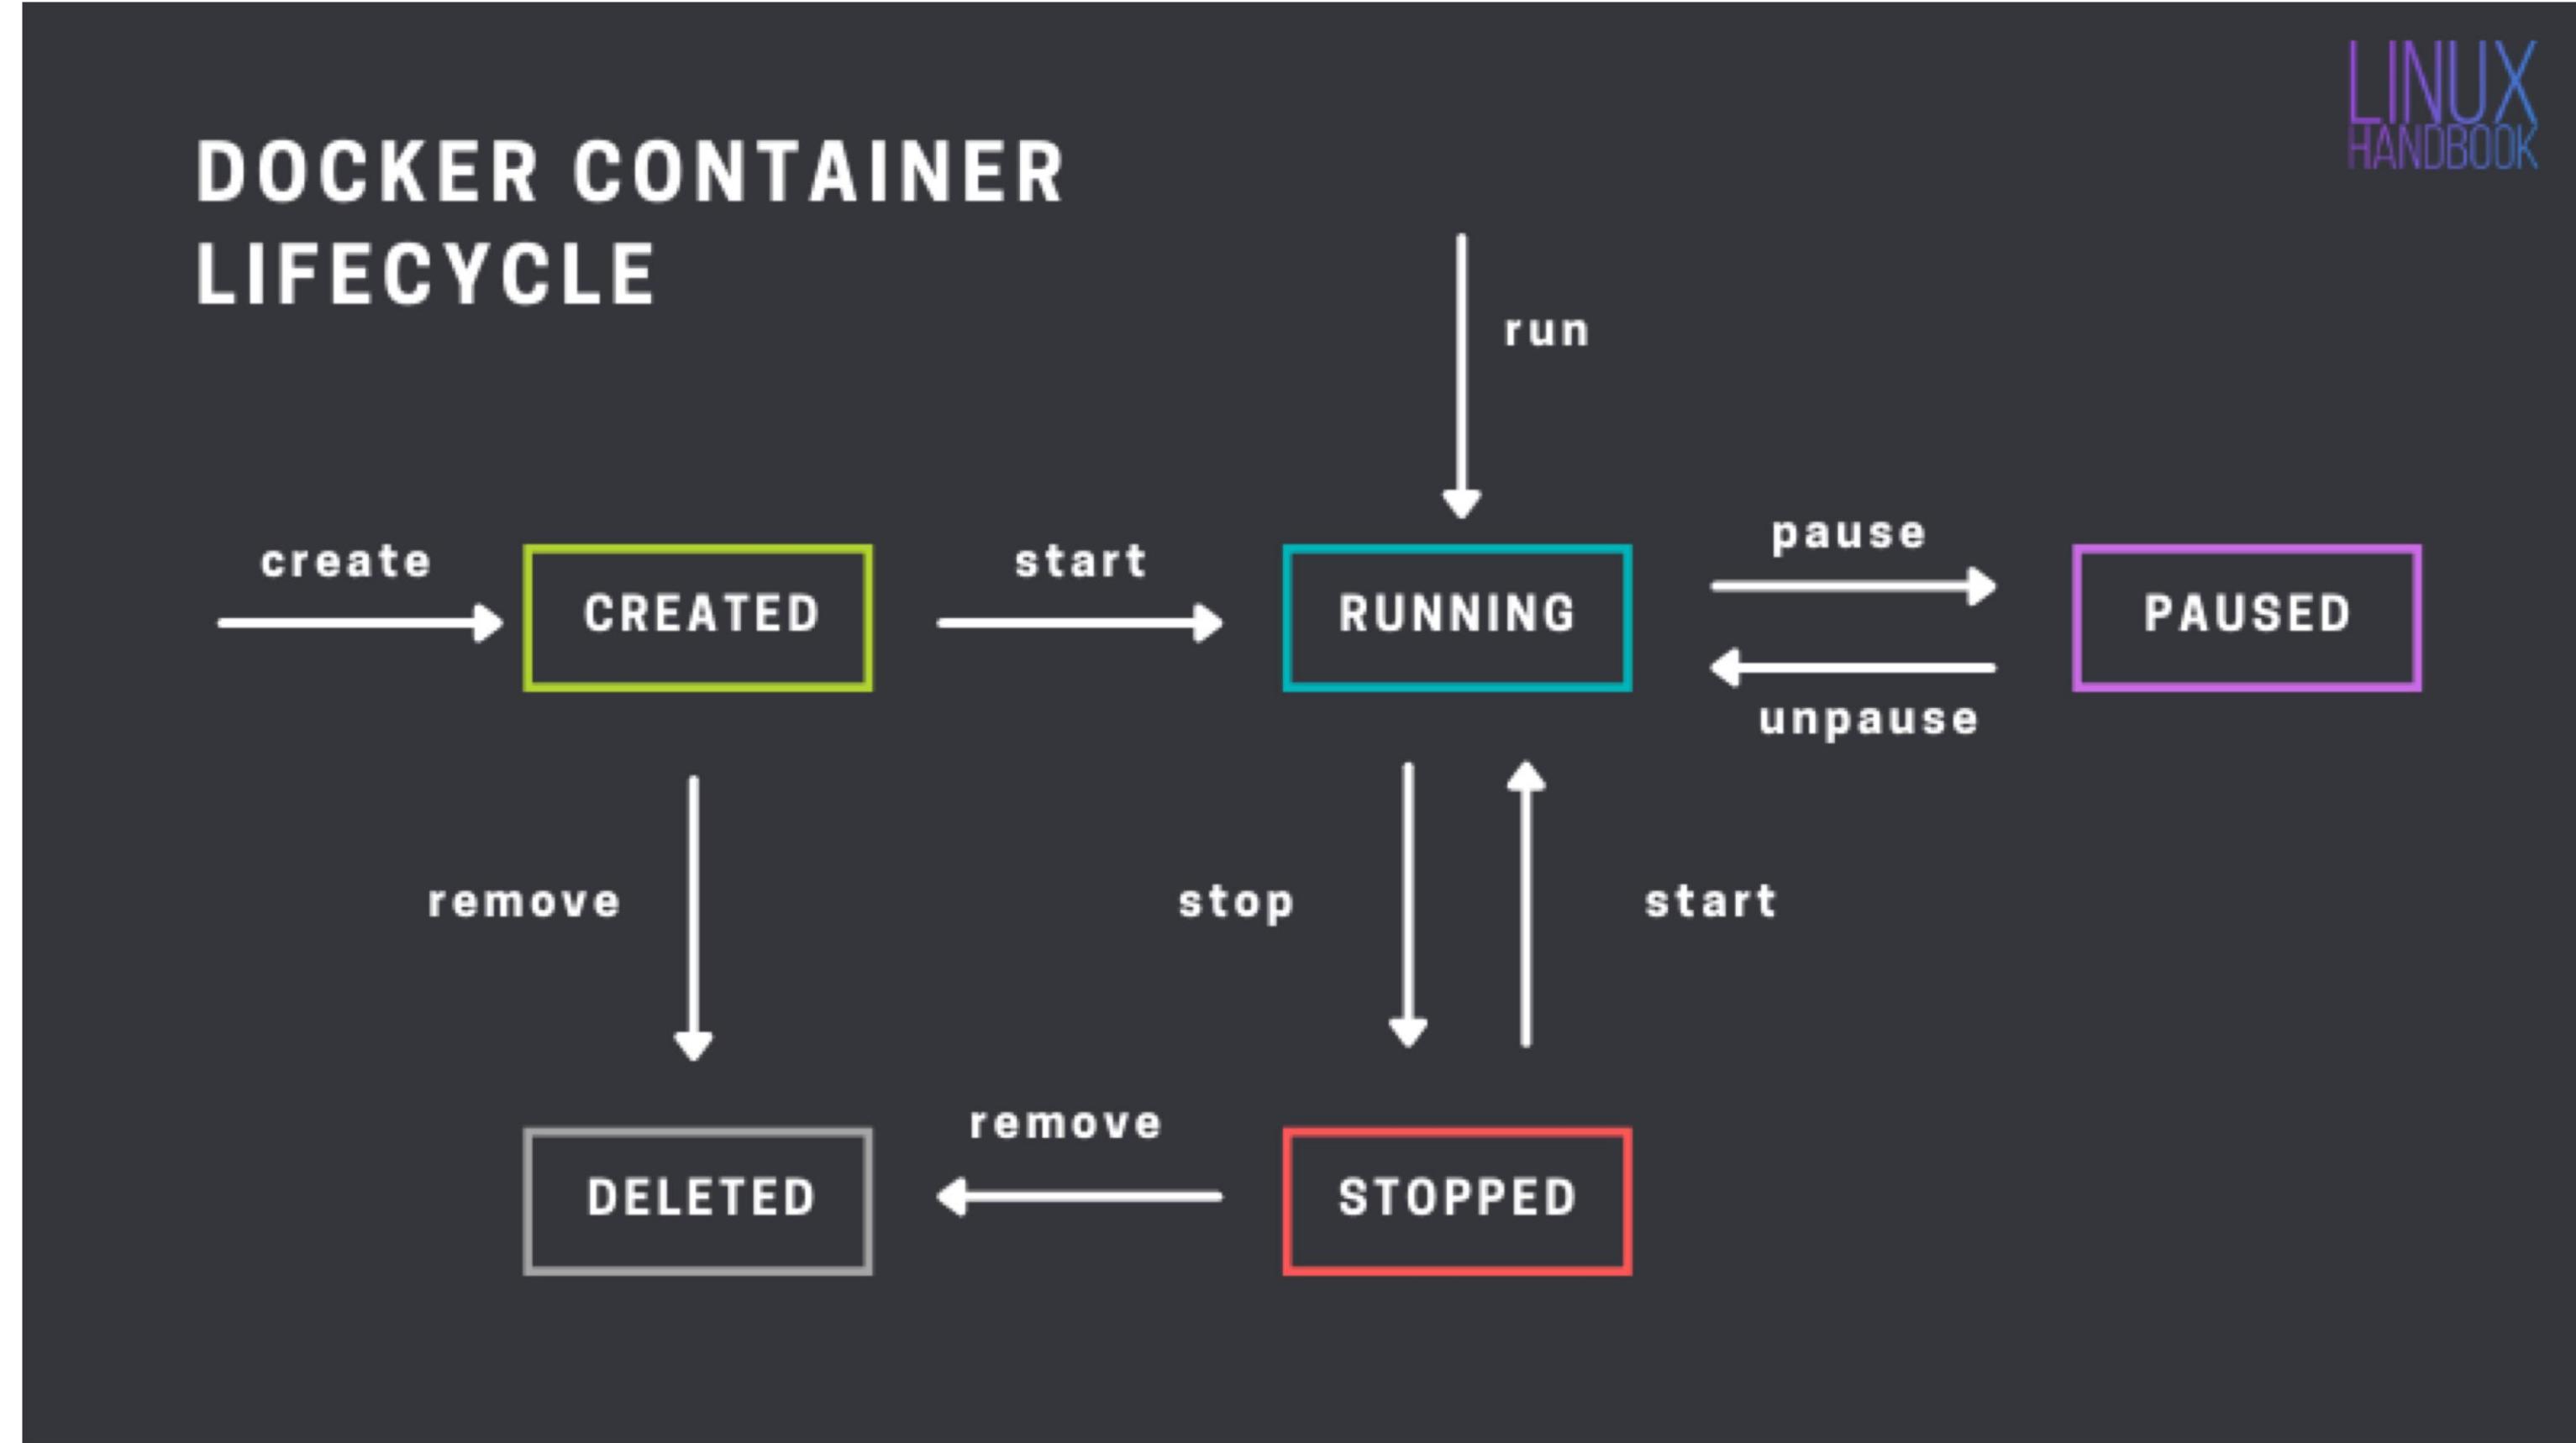

The Docker daemon :
listens for Docker API requests
and manages Docker objects

The Docker client:
primary way that many Docker
users interact with Docker

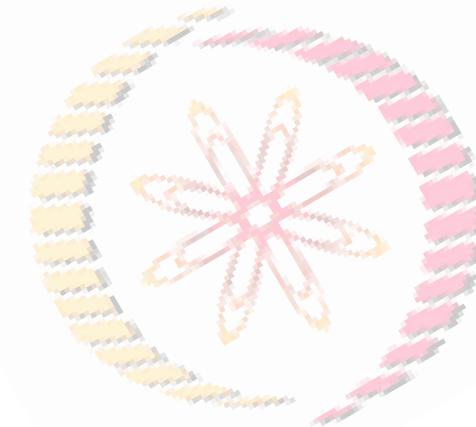

The Docker registries:
Docker registry stores Docker images.

Dockers

Demo – Dockers

NPTELTM

Demo NVIDIA NGC – Nvidia Gpu Cloud)

The NGC Catalog is a **curated set of GPU-optimized software for AI, HPC and Visualization.**

The NGC Catalog consists of containers, pre-trained models, Helm charts for Kubernetes deployments and industry specific AI toolkits with software development kits (SDKs).

NGC provides software to meet the needs of data scientists, developers, and researchers with various levels of AI expertise.

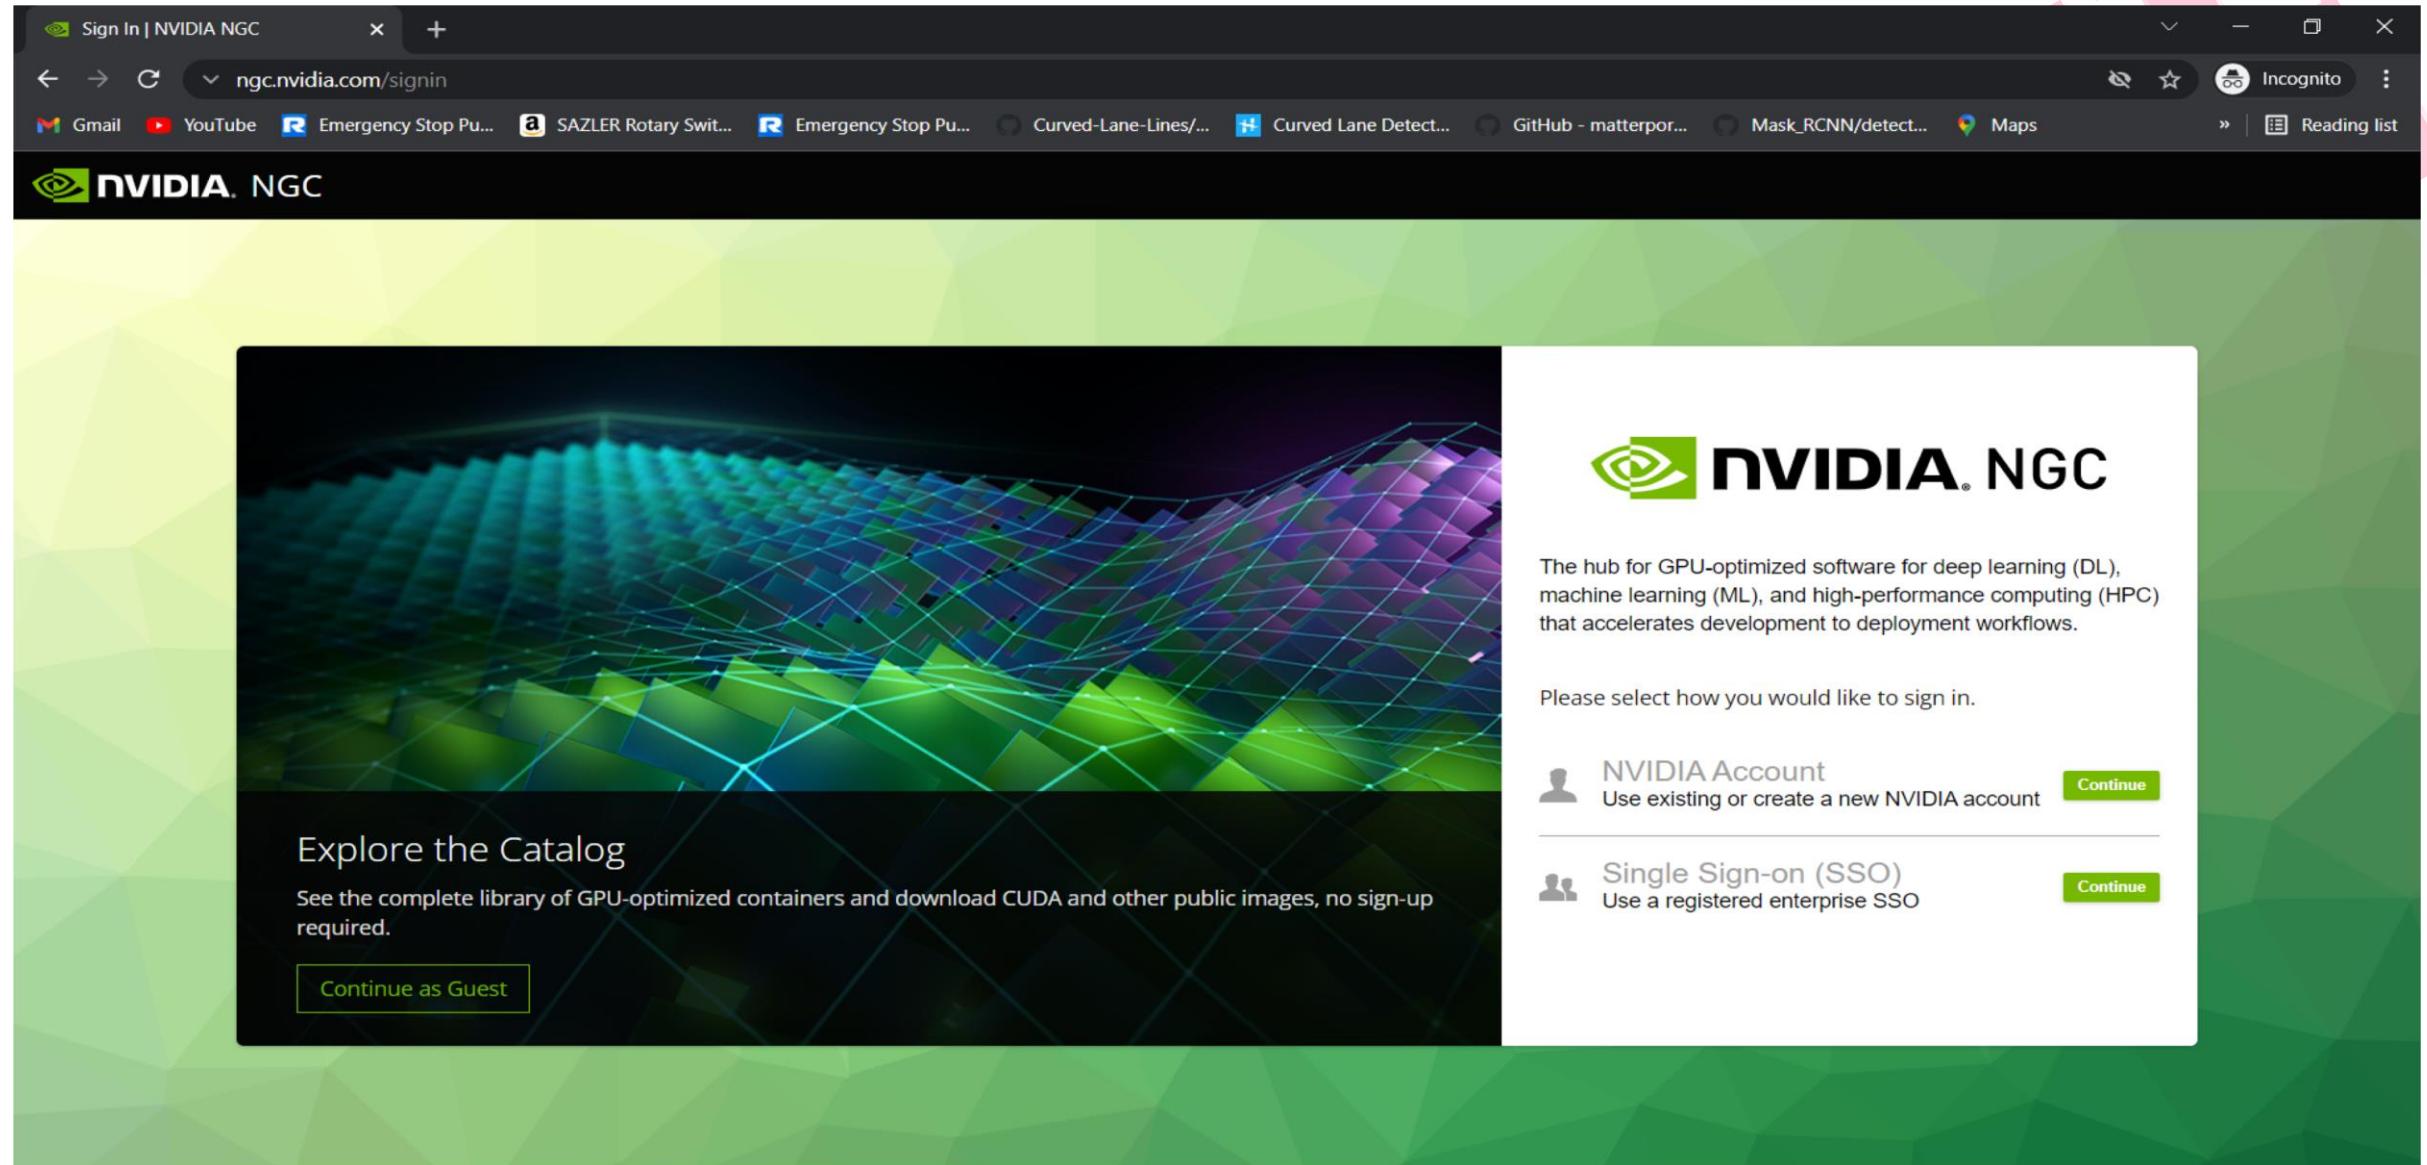

NPTEL

Accessing NGC Software

Step 1 : Signing Up for an NGC Registered Account

From your browser, go to the [NGC Sign In page](#) and then click **Continue** by the **NVIDIA Account** choice to create a new NVIDIA account

Step 2 : Go to dashboard , select containers and search for TensorFlow container

Screenshot of the NVIDIA NGC Catalog interface showing the 'Containers' section.

The interface includes a top navigation bar with links to Apps, Gmail, YouTube, Emergency Stop Pull Requests, SAZLER Rotary Switch, Emergency Stop Pull Requests, Curved-Lane-Lines/..., Curved Lane Detection, GitHub - matterport/Mask_RCNN/detect..., and Mask_RCNN/detect... .

The main area displays a grid of container cards:

- TRITON INFERENCE SERVER**: Triton Inference Server (Formerly TensorFlow Container). Described as an open source software for deploying trained AI models. Includes 'View Labels' and 'Pull Tag' buttons.
- TensorFlow**: Accelerated with NVIDIA. TensorFlow Container. Described as an open source platform for machine learning. Includes 'View Labels' and 'Pull Tag' buttons.
- PyTorch**: Accelerated with NVIDIA. PyTorch Container. Described as a GPU accelerated tensor computational framework. Includes 'View Labels' and 'Pull Tag' buttons.
- Kaldi**: Accelerated with NVIDIA. Kaldi Container. Described as an open-source software framework for speech processing. Includes 'View Labels' and 'Pull Tag' buttons.
- TENSORRT**: NVIDIA TensorRT Container. Described as a C++ library for high-performance inference on GPUs. Includes 'View Labels' and 'Pull Tag' buttons.
- NVIDIA INFRASTRUCTURE**: NVIDIA Container Toolkit Container. Described as running GPU accelerated Docker containers using the NVIDIA GPU Operator. Includes 'View Labels' and 'Pull Tag' buttons.
- MERLIN**: Merlin PyTorch Training Container. Described as allowing users to preprocess and feature engineer with NVTabular, and then train a deep-learning based recommender system. Includes 'View Labels' and 'Pull Tag' buttons.
- DEEP LEARNING INSTITUTE**: DLI Conversational AI Course - Base Environment Container. Described as the base environment for the NVIDIA Deep Learning Institute course, "Building Conversational AI Applications". Includes 'View Labels' and 'Pull Tag' buttons.

On the left sidebar, under the 'CATALOG' section, the 'Containers' option is selected. Other options include Explore Catalog, Collections, Helm Charts, Models, and Resources. A 'Learn More' button is located in the top right corner of the main content area.

Step 3 : just copy the command by clicking on **pull tag**.

TensorFlow

Container

TensorFlow is an open source platform for machine learning. It provides comprehensive tools and libraries in a flexible architecture allowing easy...

[View Labels](#) [Pull Tag](#)

Step 4 : paste the command in command prompt and execute it to download the TensorFlow image.

```

Jupyter notebook

- Developed by project jupyter.
- Ipython notebook(2011)
 - Interactive python shell at terminal.
 - Support for interactive data visualization and use of GUI toolkits.
 - Flexible, embeddable interpreters to load into one's own projects.
 - Tools for parallel computing.

● Jupyter notebook(2015)

- Jupyter Notebook (formerly IPython Notebooks) is a web-based interactive computational environment for creating notebook documents.
- Open source, interactive data science and scientific computing across over 40 programming languages (such as python, R, Julia, Scala).
- Jupyter Notebook can connect to many *kernel*s to allow programming in different languages.
- This web application allows you to create and share documents that contain live code, equations, visualization and explanatory text.
- You can use Jupyter Notebooks for all sorts of data science tasks including data cleaning and transformation, numerical simulation, exploratory data analysis, data visualization, statistical modeling, machine learning, deep learning, and much more.
